The Monterey Water, Sewer and Power Company, with an authorized capital of $4,000,000, has been incorporated at Trenton, N. J., for the purpose of constructing water and power plants and building sewers. The incorporators, headed by J. J. Jermyn, are nearly all from Scranton, Pa.

T. A. Shock of the York Haven Water and Power Company, York, Pa., reports that in the recent severe storm in that section not a wire of the system was down, while the loss of other companies was considerable. The machinery, which is gradually being placed in the plant, is arriving rapidly at present and it is thought that the entire plant will be fitted up in the next few days.

Large natural reservoirs have been discovered, it is said, by W. T. Love in the Sawtooth Mountains directly back of Nome, Alaska. Mr. Love proposes to utilize the reservoirs for furnishing water power and in his undertaking has the backing of a wealthy Nome citizen. A stock company has been formed and Mr. Love is now in Seattle, Wash., for the purpose of buying machinery and supplies. The power, when developed into electricity at the foot of the mountains where conditions favor cheap installation, will be transmitted to all parts of Seward peninsula. The company is known as the Sawtooth Electric Power Company, of which Eric Lindbloom of Nome is president and Guy C. Carleton of San Francisco secretary.

PUBLICATIONS.

The second edition of Suplee's Mechanical Engineer's Reference Book, published by the J. B. Lippincott Company of New York, has been issued, with corrections and additions. So great was the demand that the first printing was exhausted in 10 months.

Graphite lubricants made by the Joseph Dixon Crucible Company of Ampere, N. J., are looked upon with favor, and the little booklet which the company has issued regarding these products is at once complete and carefully prepared. Some of the products named in the booklet are Ticonderoga flake graphite, yachting plumbago, heavy graphite machine grease and waterproof graphite grease. Yachting plumbago, frequently called "pot-lead," is used to impart smoothness to the underbodies of sailing yachts. This polishing of the wetted surface is said to increase to a great degree the ease with which the vessel slips through the water, reducing "skin friction."

Three distinct types of arc lamps are illustrated and described in as many new bulletins coming from the Western Electric Company of Chicago. These three types are: Multiple series, constant-current lamps for direct-current circuits; multiple, constant-potential alternating-current lamps and multiple constant-potential direct-current lamps. Under each class there are a number of different types, and each of these types is carefully described and illustrated in the various bulletins. Data necessary for ease in ordering the types desired are contained in the bulletins, such, for instance, as tables containing code word, type, catalogue number, volts at arc, length of carbons, etc. For the operation of alternating-current multiple series lamps several diagrams are shown, together with directions for making connections.

AUTOMOBILES.

An automobile train with four cars was tested a few days ago near Berlin, Germany. By means of special couplings the cars were drawn after the automobile round sharp curves, keeping the same track. The velocity was 15 miles an hour. The train went over meadows at the rate of eight miles an hour. The object of such trains is transportation for war or industrial purposes.

"Spread all over the country," says the Motor World, "will be found windmills and old-fashioned water mills, often very picturesque but of no commercial value. If these power stations were to be fitted up with small electric dynamos and a few accumulators they would form very valuable charging stations for electric cars. In the near future, by the help of such charging stations, electric vehicles will be used for cross-country traveling."

TELEGRAPH.

The Montauk Telegraph Company, as successor to the New York and Long Island Telegraph Company, is applying for extensive pole privileges in and around the town of Hempstead, L. I. The local authorities intimate that the wires must go underground.

A dispatch from London, England, states that at a meeting of the Eastern Extension, Australian and China Telegraph Company, the chairman said that the competition between the two rival routes—those of the company and the governments—was being carried on as actively as ever, but so far the company has succeeded in maintaining its position, notwithstanding unfair treatment accorded it by the several governments interested. The results of the traffic with Australia showed more completely each year that no commercial necessity existed, or ever had existed, for the British Pacific cable, which involved a loss to the various governments of between £90,000 and £100,000 sterling a year, and a serious loss to the company by the abstraction of traffic under the influence of the governments. It is understood that the Pacific cable conference will meet about the first of December next.

MISCELLANEOUS.

Founders' Day exercises will be held on the evening of November 30th at the Thomas S. Clarkson Memorial School of Technology at Potsdam, N. Y.

The Schenectady plant of the American Locomotive Company, which has been idle for a month, has resumed work. Before the end of the year it is expected that the entire force of 5,000 men will be back at work engaged in the completion of the electric locomotives for the New York Central's terminal service in New York and on other orders.

The records of the legal proceedings that have taken place involving the Chicago Union Traction Company since that company went into the hands of receivers in April, 1899, make a library of 12 thick volumes of matter, compiled for the convenience of lawyers. Another ponderous book is in the hands of the binder and material for two more is being gathered.

A new danger signal is being installed along the line of the Aurora, Elgin and Chicago electric railway for the prevention of grade-crossing accidents. It is an electric light which flashes at right angles with the railway tracks at street intersections so that passengers on foot or in vehicles approaching the crossing are warned of the coming of a car while it is 300 yards away. At the same time an electric bell starts ringing. The light is an arc and is so arranged as to shine only up and down the intersecting streets and not upon the track. It is set in operation at the approach of a car by an electric contact similar to that employed in a block-signal system.

TRADE NEWS.

The Electric Supply Company of Savannah, Ga., has increased its capital from $25,000 to $37,500.

The F. M. Russell Fixture Company of Omaha, Neb., has been incorporated and succeeds to the gas and electrical fixture business of F. M. Russell & Co.

Milton Greenebaum of New York city, and business associates have organized the Independent Insulator Company, with a capital of $250,000. The new firm will deal in glass insulators.

It has been decided by the Australian commonwealth that rheostats are auxiliaries and not integral parts of electric appliances or machines, and should be classified as electric materials, free of duty.

Advices from Poland say there is a good opening in that country for electric apparatus, such as motors, batteries, dynamos, accumulators, electric-lighting material, incandescent and arc lamps, electric bells and telephone material. The trade in these goods is expected to increase.

The Bureau of Supplies and Accounts, Navy Department, is inviting sealed proposals until December 6th, for furnishing the New York navy yard with a quantity of searchlight projectors, electric blowers, annunciators and other electrical materials. Blank proposals will be furnished upon application to the navy pay office in New York.

An electrically operated appliance for reproducing cartoons and other drawings is being put on the market by the Rossman Electric Delineator Company of Rochester, N. Y. This concern was incorporated on November 17th at Albany with a capital of $40,000. G. B. Rossman of New York city is financially interested in the new corporation.

It is stated in financial circles that a great electrical company is about to be established under the auspices of the Deutsche Bank, Thomas A. Edison and the Bergmann Elektricitäts Werke Actien Gesellschaft of Berlin. The president of the Bergmann concern, Sigmund Bergmann, is said recently to have visited Mr. Edison to arrange the details. According to one version, the new company will be situated in the United States.

The Specialty Manufacturing Company has recently moved into new quarters at 32 East South Street, Indianapolis, Ind., where every facility for supplying its well-known line of ventilating fans is at hand.

The Barousse Street Car Fender Company of New Orleans, La., has been incorporated with $200,000 capital, to manufacture the "Barousse" street-car fender. Eugene Barousse is president; Ira F. Swahn, vice-president, and F. S. Fowler, secretary-treasurer.

The New England offices of the Allis-Chalmers Company in Boston, which are now in the Board of Trade Building, and the offices of its electrical department, the Bullock Electric Manufacturing Company, in the Journal Building, will be consolidated on December 1st and removed to the State Mutual Building, 50 Congress Street. Mr. George H. Berg will be the manager in charge of the consolidated offices.

Through the Bureau of Supplies and Accounts bids are invited by the Navy Department until November 29th, for furnishing the League Island and Washington navy yards with incandescent lamps, telephone sets and miscellaneous electrical supplies, a full list of which may be obtained upon application to the navy pay offices in Philadelphia and Baltimore, and to the bureau. On December 13th the bureau will open bids for furnishing the Mare Island and Puget Sound navy yards with a quantity of wattmeters, voltmeters, conduit, engine indicators, copper and magnet wire, fuse wire, electric clusters, insulating and Grimshaw tape, carbons, miscellaneous electric supplies and a telephone system. Blank forms of proposal can be obtained either of the bureau or at the navy pay offices in San Francisco, Cal., or Seattle, Wash. The Bureau of Supplies and Accounts is about to change the hour of opening bids from noon to 10 o'clock. This change will become effective December 6th, and no bids will be considered that are received after that hour.

BUSINESS.

The Innovate adjustable hangers for lamp cords, described and illustrated in the Western Electrician last week, are handled by the Innovate Manufacturing Company, 145 Van Buren Street, Chicago.

Thus the Buckeye Electric Company of Cleveland: "General Grant knew but two tunes. One was 'Yankee Doodle'—and all the others weren't. There are only two lamps. One is Buckeye—and all the others aren't. Which will you have?"

The W. R. Evans Engineering and Construction Company, Traction Building, Cincinnati, Ohio, has been organized and incorporated for the purpose of building, financing, promoting and engineering street railways, electric-light plants, waterworks, etc. Mr. W. R. Evans is president of the new concern, and with a staff of capable engineers is able to give satisfactory services.

The Crocker-Wheeler Company of Ampere, N. J., is introducing a new line of variable-speed motors designed for machine-tool drive. These motors are arranged in two classes, the first being adapted to give a constant horsepower throughout a speed range of two to one, and the second being arranged to give a constant horsepower throughout a speed range of three to one. Both of these classes are designed for operation on a single voltage of either 115 or 230 volts.

Three Westinghouse 62½-kilowatt engine-type generators which have been in service in the basement of the New England Building, in Cleveland, Ohio, were recently subjected to a severe test. A fire occurred in the basement where the generators were installed and completely burned away the insulation on the outside of the field coils; the fire department played upon these machines with six lines of hose for one hour. Within one hour from the time the water was turned off the machines, one of them was in operation and carrying its full rated load. The second machine was put in operation later and carried its full rated load, and at the present time two of these machines are operating under the load normally carried by all three of them.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued (United States Patent Office) November 15, 1904.

774,749. Portable Electric Light. Edwin R. Gill, New York, N. Y., assignor to the Electric Contract Company. Application filed January 25, 1902.

A cylindrical casing holds the battery, and upon pressing a spring connections are made and a small incandescent lamp inside the tube is lighted.

774,758. Electric Spark Gap. Thomas B. Kinraide, Boston, Mass. Application filed May 25, 1904.

Heat-separating means consist of a series of thin members of heat-conductive material extending laterally outward and located contiguous to the discharge gap for diverting and separating from the electric current the heat effects and providing a cool discharge between electrodes.

774,760. Self-contained Hand Electrode. Thomas B. Kinraide, Boston, Mass. Application filed July 5, 1904.

A hand device or electrode for hand manipulation at the point of application comprises a portable inclosure provided with a carrying device adapted to be grasped by the hand, the portable inclosure adapted to be connected to a source of high-frequency current and containing within itself means for developing from the current a high-frequency high-potential disruptive discharge current.

774,764. System of Electrical Distribution. Paul M. Lincoln, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed September 30, 1903.

Combined with a source of direct current are a source of alternating current and translating devices to be supplied therefrom, an alternating-current controller, a direct-current controller and means for automatically cutting either of the controllers out of circuit and the other into circuit when the corresponding generator is cut into or out of circuit.

774,770. Central-energy Telephone System. Kempster B. Miller, Chicago, Ill., assignor to the Kellogg Switchboard and Supply Company, Chicago, Ill. Application filed December 19, 1900.

A supervisory signal-controlling electromagnet having differential windings is disposed in the path of current from the source over the line circuit, the magnet being rendered neutral by the current over the metallic circuit during conversation and energized by the excess of the magnetic effect in one of the differential coils at the termination of the conversation. A cut-off relay for the line connects the terminal with the line when operated and renders the signal inoperative. Means are supplied to energize the relay by the act of connecting the cord circuit with the line without unbalancing the signal-controlling electromagnet.

774,789. Electric Arc Lamp. Ralph Scott, Wilkesbarre, Pa., assignor of one-half to Marcus A. Miller, New York, N. Y. Application filed October 14, 1903.

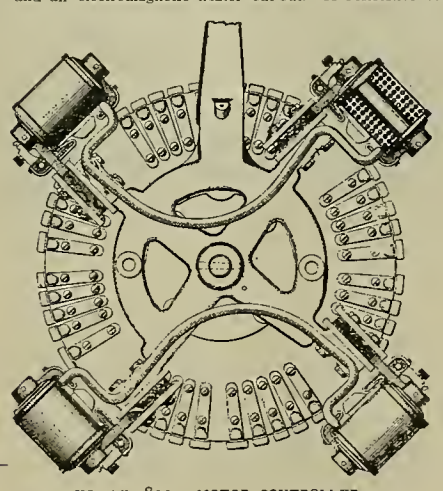
Associated with a movable carbon support are a carbon pencil-engaging pawl, a carbon support beneath the movable carbon support and a plunger carried by the movable carbon support. A circuit is provided for the carbon supports, a coil surrounds the plunger, and means limit the downward movement of the movable carbon support, limiting the degree of release of the clutch.

774,800. Controller for Electric Motors. Hermon L. Van Valkenburg, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed April 14, 1904.

A controller for electric motors having a stationary member comprises a non-conducting disk and circumferentially disposed contact terminals, which are insulated from each other by it and which embrace its edge and the contact portions of which are independently removable. (See cut.)

774,812. System of Distribution for Electric Glower Lamps. Alexander J. Wurts, Pittsburg, Pa., assignor to George Westinghouse, Pittsburg, Pa. Application filed November 9, 1900.

Electric lamps of the type described are connected in series with each other and each has a glower, a heater and an electromagnetic heater cut-out. A resistance coil



NO. 774,800.—MOTOR CONTROLLER.

is connected in shunt to the glower and heater and in series with a cut-out coil of each lamp.

774,813. Electric Signaling System. Samuel M. Young and Fitzhugh Townsend, New York, N. Y., assignors to said Young. Application filed August 22, 1904.

A system of automatic signaling for electric railways comprises a generator and a power circuit, including the rails of the trackway as a return. The trackway is divided into a series of sections by dividing one rail and introducing between its separated ends a conductor which forms the secondary of two transformers connected in series, the secondaries being in parallel across the rails. The arrangement is such that one transformer of each pair will be included in adjacent track sections.

774,815. Electric Indicating Mechanism for Pressure Gauges. James P. Anderson, U. S. Navy. Application filed March 16, 1903.

The pointer of the pressure gauge in traveling over the dial closes various contacts, which close circuits leading to a dial in a distant place. (See cut on next page.)

774,831. Electric Burglar-alarm System. Clyde Coleman, Chicago, Ill., assignor of two-thirds to the Bankers' Electric Protective Company, Chicago, Ill. Application filed December 17, 1896.

Combined with a protective circuit and a responsive device therein is an electrically operated multiple permutating circuit-breaker in the circuit, constructed to produce a series of successive breaks or pulsations of current strength each time it is thrown into operation.

774,836. Vacuum Arc Lamp. Hubert Emonds, Aix-la-Chapelle, Germany. Application filed January 30, 1904.

A closed chamber contains the electrodes and an extension on the chamber acts as a guide for the upper carbon. A carrier is supplied for the clutch mechanism, likewise a solenoid, a movable core therefor, provided with an extension constituting a movable pole piece in proximity to the extension of the inclosing chamber, a soft-iron armature guided in the extension and moving with the movable pole piece, and a clutch carried by the armature. (See cut on next page.)

774,876. Electric Arc Lamp. Thomas Hamilton-Adams, London, England. Application filed August 21, 1903.

A radiating tube is hermetically united to a foundation plate communicating with a guiding aperture, and extends outside of the lamp body for radiating the heat generated by the arc, and this obviates the use of pressure-relieving devices.

774,896. Electric Safety Apparatus for Cars or Trains. William P. Robertson, Bronxville, N. Y. Application filed May 12, 1904.

A train has in combination with its cars provided with gates or doors a controller, a lock therefor, a signal, connections from the signal for an electric circuit for the signal and for commanding the lock, and means under control of either of the gates or doors to cause the operation of the lock and signal.

774,897. Block Signal System for Electric Railroads. Howell W. Souder, Tamaqua, Pa., assignor of one-half to W. D. Zehner, Lansford, Pa. Application filed December 7, 1903.

As elements in an electric-signaling system there are combined a rotating circuit controller, divided into a series of circumferentially separated contact sections, the angular distances between the centers of any two adjacent contact sections being uniform throughout, and means giving the controller a step-by-step rotary movement always in one direction, each step being equal to one-half the angular distance between the centers of two adjacent contact sections. There are also a work-circuit terminal, a feed-connection terminal and a ground-connection terminal, all arranged in the path of rotation of the controller contacts.

774,905. Telegraph Repeater. William E. Athearn, New York, N. Y., assignor to the American Telephone and Telegraph Company, Boston, Mass. Application filed May 13, 1904.

The associated parts are a relay of each line, an associated local circuit, an auxiliary electromagnet included therein and acting upon the armature lever of the relay in the direction of its normal attraction, and a short-circuiting shunt of the local circuit round the auxiliary magnet controlled by the relay of the other line. An electromagnetic resistance or reaction coil is connected in the local circuit outside of the shunt and is adapted, when the shunt is broken, to discharge reactively through the auxiliary electromagnet and to quicken the magnetization thereof.

774,922. Apparatus for Receiving Electrical Impulses. Daniel W. Troy, New York, N. Y. Application filed April 11, 1904.

A local circuit has one portion formed of comminuted magnetic particles in relatively loose contact. There is a normally alternating magnetic flux through the particles, and a winding around the particles adapted to be energized by received impulses. (See cut.)

774,923. Receiver for Telephones or the Like. Daniel W. Troy, New York, N. Y. Application filed June 24, 1904.

A wheel of magnetically permeable material is normally rotated and forms a part of a magnetic circuit. A magnetic armature in sliding contact therewith is directly connected to a diaphragm, and means for varying the friction between the wheel and armature by received impulses are supplied.

774,929. Protecting Diaphragm for Telephone Transmitters. William M. Bashlin, Warren, Pa. Application filed October 28, 1903.

In combination with a telephone transmitter having a mouthpiece is a removable protecting diaphragm arranged over the opening in the mouthpiece and means for stretching and clamping the protecting diaphragm about the edge of the mouthpiece.

774,943. Controller. Ray P. Jackson, Wilkinsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed January 20, 1904.

In apparatus for slowly rotating the field magnet of an alternating-current machine are means for successively supplying direct-current energy to the several portions of the polyphase armature winding and for alternately decreasing and increasing, in gradations, the amount of current supplied to each of the portions.

774,954. 774,955. 774,956. Method of Rotating Field Magnets of Dynamo-electric Machines. Charles F. Scott, Edgewood Park, Pa., assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed September 16, 1903.

These three patents relate to a method of rotating the field magnet of a polyphase alternating-current generator, which consists in energizing the field magnet and supplying direct current to the armature winding corresponding to a single-phase and to series-connected armature windings corresponding to two phases alternately and successively, and reversing the current when 180 electrical degrees of rotation have been produced.

774,974. Safety Device for Coupling Alternators. Edwin S. Baker and Herbert A. Scott, Piedmont, W. Va. Application filed November 12, 1903.

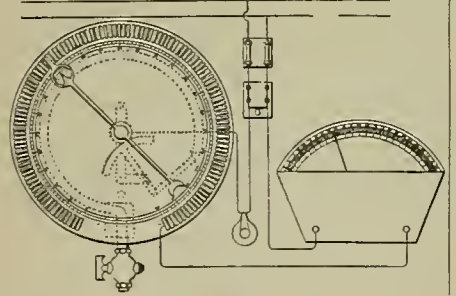
Two alternating-current generators are brought up to the proper voltage and synchronism. A phase indicator is connected up with the generators, and safety devices in circuit with the generators prevent injury to either generator when they are included in parallel circuit with each other on the main-line conductors.

774,976. Electroplating Isolated Designs on Vitreous Surfaces. Leon Blower, New York, N. Y. Application filed March 23, 1904.

The process of forming an isolated metallic design upon an article having a vitreous surface consists in pulverizing the desired metal and mixing it with a suitable flux, applying the mixture in a paste to the vitreous surface in the desired design, fusing the mixture of pulverized metal and flux upon the vitreous surface, and then increasing the thickness of the fused metal in such design by electrodeposition.

774,991. Register for Telephones. George S. Nickum, Salt Lake City, Utah, assignor of one-half to Harry E. Deardorff, Salt Lake City, Utah. Application filed April 4, 1904.

In telephone registering mechanism are a transmitter, a register case connected therewith and having an opening against the diaphragm, sounding mechanism within the register case, registering mechanism within the register case and means for operating the register and sounding mechanism.



NO. 774,815.—PRESSURE INDICATOR.

775,016. Electric Switch. Isaac G. Waterman, Santa Barbara, Cal. Application filed March 9, 1903.

Details are described.

775,017, 775,018, 775,019, 775,020, 775,021. Electromagnetic Valve-controlling Mechanism. Isaac G. Waterman, Santa Barbara, Cal. Application filed May 11, 1903.

These five patents relate to devices for automatically opening or closing the supply and waste valves in a fluid receptacle, such, for instance, as a bath tub.

775,050. Method of Selecting Electrical Impulses. Daniel W. Troy, New York, N. Y. Application filed April 8, 1904.

The method of selecting electrical impulses set forth consists in operating vibratory receiving apparatus by the mutual action of components of received impulses at approximately 90 degrees difference of phase.

775,051. Electrical Valve-controlling Mechanism. Isaac G. Waterman, Santa Barbara, Cal. Application filed August 4, 1902.

An electrical supply circuit and a switch and electrically operated valve embraced therein, a second circuit connected in shunt to the electrically operated valve, a normally open circuit-closer for the shunt circuit and an electromagnet included in the shunt circuit and adapted for opening the switch on closing of the normally open circuit-closer, are the essential features.

775,052. Electric Switch. Isaac G. Waterman, Santa Barbara, Cal. Application filed January 31, 1903.

In an electric switch are combined a movable switch-contact member and a spring for returning it to normal position.

775,053. Electric Switch. Isaac G. Waterman, Santa Barbara, Cal. Application filed June 29, 1903.

Details are described.

775,054. Electromagnetic Valve. Isaac G. Waterman, Santa Barbara, Cal. Application filed March 9, 1903. Renewed December 24, 1903.

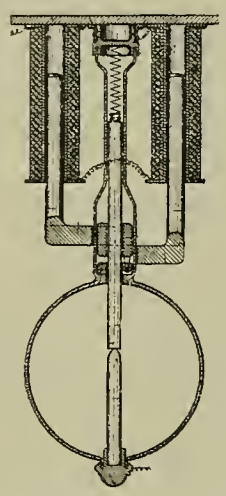
Characteristic features of the device are a valve casing, a valve and a slidable magnet core, a magnet coil for attracting the core, a slidable locking core disposed substantially at right angles to the magnet core and adapted to automatically engage it, and a magnet coil for retracting the locking core.

775,055. Electric Switch. Isaac G. Waterman, Santa Barbara, Cal. Application filed March 25, 1903. Renewed September 7, 1904.

In an electric switch are a stationary contact, a rotary contact arranged to only momentarily or temporarily engage the stationary contact when actuated, a spring-retracted push-button and a pawl carried thereby adapted to snap the rotary contact first on, then off, the stationary contact during the automatic spring retraction of the push-button.

775,056. Electrical Contact-controlling Float. Isaac G. Waterman, Santa Barbara, Cal. Application filed June 25, 1903. Renewed September 7, 1904.

Combined with relatively movable contacts adapted for engagement is electromagnetic mechanism adapted to separate the contacts at the time they are brought together and to keep them separated.



NO. 774,835.—VACUUM ARC LAMP.

775,079. Signal for the Deaf. Albert Ekberg, Minneapolis, Minn. Application filed September 5, 1903.

A spring motor and a rack arranged to be reciprocated thereby are connected to a pivoted arm having a toothed segment meshing with the rack and provided at its free end with a visual signaling device. An electrically operated detent normally restrains the spring motor.

775,105. Electric Baker for Surgical Purposes. Walter S. Edmands, Newton and Charles A. Hoyt, Boston, Mass., assignors to Edward T. Edmands, Newton, Mass., and June Hoyt. Application filed December 17, 1902.

Electric elements electrically connected in groups within the oven are provided with switch connections whereby the groups may be placed in and out of operation singly and jointly.

775,113. Coherer. Walter W. Massie, Providence, R. I. Application filed March 4, 1904.

A coherer comprising a mass of non-magnetic filings contains a magnetized needle supported with its end free of the mass of filings. A mass of magnetic filings is suspended from the needle and makes contact with the non-magnetic filings.

775,123. Apparatus for Electrically Treating Gases. Kristian Birkeland, Christiania, Norway. Application filed June 15, 1903.

Means for producing a magnetic field consist of pairs of electrodes mounted in the field, each pair being arranged to produce an arc; means for supplying current to the electrodes and means for passing a current of gas past the arc in series.

775,145. Electromagnet. William Meyer, Chicago, Ill., assignor to the Kellogg Switchboard and Supply Company, Chicago, Ill. Application filed August 26, 1901.

Combined with a magnet core is a bar of magnetic material connected at one end. An angular armature poised upon and in contact with the other end of the bar is adapted, upon being attracted by the core, to form a closed magnetic circuit with the core and the bar.

775,165. Safety Alarm. Levi N. Coffield, Clarksburg, W. Va. Application filed June 30, 1903.

In an alarm of the character described are a piston chamber, a piston, upright bars secured to opposite sides of the cylinder, a weight guided by the bars and engaged by the rod of the piston, a contact piece adjustable on the rod, an electric circuit and a circuit-closer mounted on one of the bars and having opposite parallel branches between which the contact piece is movable.

775,188. Thermopile Elements. John A. Lyons and Edward C. Broadwell, Chicago, Ill. Application filed July 6, 1903. Renewed July 6, 1904.

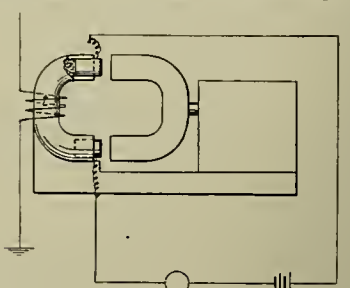
A thermopile has negative and positive elements, one composed of a mixture of iron sulphide and lead sulphide and the other of a mixture of a copper phosphide and another dissimilar metallic salt.

775,199. Railway Signal. Cisco R. Traxler, Winston Salem, N. C. Application filed December 31, 1903.

In railway signaling systems are embodied a compressed-air duct parallel with the roadbed, signals arranged at points distant from each other, signal-operating means, electromagnetically controlled valves for placing the duct in communication with the operating means and a current conductor passing through the duct and protected thereby.

775,201. Telephone System. William R. Whitehorne, Bethlehem, Pa. Application filed April 27, 1904.

A telephone system includes two conducting lines in the same circuit, electrical instruments connected thereon, each provided with a locking device, including a differ-



NO. 774,922.—ELECTRICAL IMPULSE RECEIVER.

entially wound magnet, an indicator and a calling device, with means having its terminals connected respectively to the ends of the lines for operating the calling device of any instrument and for actuating the indicators and the locking devices of the remaining instruments.

775,226, 775,227, 775,228, 775,229. Telephone-exchange System. Harry G. Webster, Chicago, Ill., assignor to the Stromberg-Carlson Telephone Company, Rochester, N. Y. Application filed February 4, 1903.

Means at the sub-station are adapted to close an electrical connection between the telephone limbs of the line. Cord connecting apparatus at the exchange connects the line with another for conversation. A cut-off relay has two differential windings serially included in one limb of the line, and a test contact is connected to the common terminal of the windings of the differential cut-off relay.

775,230. Circuit-changing Apparatus. Harry G. Webster, Chicago, Ill., assignor to the Stromberg-Carlson Telephone Manufacturing Company, Rochester, N. Y. Application filed December 7, 1903.

A core is provided with pole pieces, an energizing coil for the core, an armature hinged to one of the pole pieces and extending over the other pole piece, switching mechanism disposed below the armature, a distance plate disposed between the swinging end of the armature and actuating springs of the switching mechanism, apertures through the swinging end of the armature and the actuating springs, and pins extending from the distance plate for loosely engaging the aperture, whereby the distance plate is readily removable.

775,274. Insulated Electric Conductor. John A. Heany, York, Pa., assignor to the Teter-Heany Developing Company, Charleston, W. Va. Application filed February 4, 1904.

An electric conductor has upon its surface a series of transversely arranged indentations or notches combined with an insulating covering firmly united to the surface of the conductor and interlocking with the indentations.

775,276. Trolley System for Overhead Electric Lines. James B. Kline, Warren, Pa., assignor of two-thirds to Starling W. Waters and Charles E. Metzgar, Warren, Pa. Application filed February 1, 1904. Renewed October 19, 1904.

A trolley for overhead lines comprises a guard and holder for the trolley wheel consisting of a housing U-shaped in cross-section and provided with rectangular mortises in the upper edges of its opposite sides. Rectangular journal blocks are seated in the mortises, and a trolley wheel is arranged in the housing and provided with an axle journaled at its ends in the journal blocks.

775,282. Electric Furnace. Richard Raddatz, Milwaukee, Wis., assignor of nine-tenths to the Allis-Chalmers Company. Application filed June 23, 1899.

Means for varying the relative movements of the bed of the furnace and the feeding devices are provided together with electrodes having their ends brought within arcing distance of each other in proximity to the point at which the feeding devices deliver material upon the bed.

775,284. Electric Testing Clip. Harry Frankel, New York, N. Y. Application filed December 2, 1903.

Details are described.

EXPIRING PATENTS.

Following is a list of electrical patents (issued by the United States Patent Office) that expired on November 22, 1904:

373,435. Galvanic Battery. H. J. Brewer, New York, N. Y.
373,452. Insulating Joint or Pipe Coupling. Emil F. Genert, Brooklyn, N. Y.
373,508. Printing Telegraph. C. J. Wiley, Brooklyn, N. Y.
373,519. Telephone Apparatus. I. H. Farnham, Malden, Mass.
373,584. Dynamo Electric Machine. T. A. Edison, Llewellin Park, N. J.
373,601. Apparatus for Purifying and Separating Fatty Substances by Electricity. H. F. D. Schwahn, Kansas City, Mo.

WESTERN ELECTRICIAN

EVERY SATURDAY

Vol. XXXV. CHICAGO, DECEMBER 3, 1904 No. 23

Electric Power in the Linz Railway Shops in Austria.

By Emile Guarini.

Electric power has recently been introduced at the workshops of the railway company at Linz, Austria. The entire plant has been constructed by the Vereinigte Elektricitäts Actien Gesellschaft of Vienna, and it consists of no less than 25 motors. Two-hundred-and-twenty-volt three-phase current is motive power that has been selected. It is supplied by a three-phase alternator of 200 kilovolt-amperes, driven by a 300-horsepower steam engine. Excepting two 10-horsepower motors, all the motors are on the ring system.

The driving of the traveling cranes and turntables is of special interest. For instance, a traveling crane of 20-ton capacity and a range of 9½ meters, located in the boiler works, is actuated by one single three-phase motor, through the agency of a worm gearing and toothed wheel, mounted on a shaft from which the three movements are derived. A view in the boiler works showing this crane is shown in Fig. 1. The shaft of the motor is connected to the worm gear by a coupling, one half of which acts as a disk brake. The band of the brake is raised by an electromagnet capable of lifting 0.5 kilogram, when current is supplied to it. This traveling crane existed prior to the introduction of electric power. It was found very easy to adapt it to the new circumstances.

The operator for the bridge stands upon the platform and operates the starting mechanism by the aid of a sprocket wheel and chain. There are only three conductors, i. e., one for each phase. There is no frictional transmission, and the motor must never be allowed to run light. The power developed is seven horsepower at 1,440 revolutions per minute. There are four of these cranes or bridges in the boiler works. There are, furthermore, two 45-ton overhead bridges in the locomotive fitters' shop, each provided with three seven-horsepower motors.

Traveling platforms or transfer tables for moving the cars laterally in the shops are adapted to take a load of 12 tons, and they have a speed of movement of 15 meters per minute. They are provided with a three-phase motor of 4½ horsepower at 900 revolutions per minute. The propelling mechanism comprises a chain transmitting device, and worm and gear wheels mounted in an oil bath. A disk brake is placed on the axis of the worm gear, and it is faced with leather. It is operated by means of a pedal and released by the action of a tension spring. The starting device is placed opposite the pedal. Fig. 2 is a picture illustrating this transfer table and showing the arrangement of the trolley by which the three-phase current is collected for the motor.

The bridge for the lateral movement of the locomotives (Fig. 3) is adapted for a speed of 12 meters per minute with a load of 56 tons. The motion is derived from a 10-horsepower three-phase motor, making about 1,330 revolutions per minute.

In these workshops there is also a large riveting machine, which is worthy of mention; it is driven by a 20-horsepower three-phase motor, with shafting and wheel gear. It also drives, by means of a belt, a plant of pumping apparatus. The current is taken from off the general lead. The riveting plant consists of a sextuple pump of 130 atmospheres pressure, with a maximum power of 90 liters of water under pressure, per minute, and also of a differential density accumulator of 40 liters capacity, with two meters travel. Great precision is requisite for the working of this last-named machine, and, to this end, the motor and pump run without interruption. A pressure commutator is merely inserted in the pressure pipe of the pump, and this controls the working of the accumulator.

FIG. 1. ELECTRIC POWER IN THE LINZ RAILWAY SHOPS IN AUSTRIA.—CRANE OPERATED BY THREE-PHASE MOTOR.

The Chicago Subway Company, which is to take over the Illinois Tunnel Company, has made its formal offer for the property. It already has acquired all the stock of the older company, and holds the $12,000,000 of bonds issued. For the stock of the Illinois company $30 a share in cash and $70 in shares of the Chicago Subway Company, par value, is offered. The stock is to be deposited with J. B. Russell & Co., New York, by December 31st.

Municipal Ownership of Public Utilities in England.

James Boyle, United States consul at Liverpool, England, writing under the heading, "Depressed Labor Conditions in Great Britain," has the following to say about municipal ownership of public utilities:

"There is an unmistakable cessation of the tendency toward the 'municipalization' of industries, which seemed to have fairly captivated the English people a few years ago, and which threatened to become almost epidemic, embracing not only public utilities, but a large variety of what had generally been considered to belong to the category of individual enterprises exclusively. Very little is heard just now of new movements in this direction; and indeed there are influences at work, well organized though quiet, which have for their object the wiping out, or, at any rate, the curtailment of 'municipal socialism.' This movement is taking advantage of the fact of the growing opposition to increased municipal taxes, the claim being made that the 'municipalization' of industrial enterprises not only kills individual effort, but adds to the municipal rates. Of course, there is another side to this question. Still, it is significant that local authorities who are committed to the 'municipalization' system are now devoting their chief energies to economy of management, and to bringing out a good financial showing at the end of the year, so that the profits can go to the general fund, and thus ward off any increase in the taxes."

National Electric Light Association Will Meet in Denver and Colorado Springs.

President Davis of the National Electric Light Association has just returned from a trip to Colorado, where he went for the purpose of deciding upon the meeting place of the twenty-eighth convention of the National Electric Light Association. After visiting Denver and Colorado Springs and conferring with a number of western members, it was decided that the business meetings of the convention be held in Denver for three days and the delegates then be taken to Colorado Springs for

the entertainment portion of the meeting, giving two or three days to sight-seeing and social intercourse. The meeting will be known as the Denver-Colorado Springs convention.

American Institute of Electrical Engineers.

The meeting of the American Institute of Electrical Engineers which was held in Carnegie Hall, New York city, on November 25th, brought out a very thorough discussion of the paper presented by O. S. Lyford, Jr., and W. N. Smith, on "Problems of Heavy Electric Traction." Extracts from the paper and discussion appear in succeeding columns of this issue. The subject was one of much interest and the attendance at the meeting when called to order by President J. W. Lieb was large. The president announced that at the meeting of the board of directors that afternoon 53 were elected to associate membership in the association. The following-named gentlemen were transferred from associate membership to full membership: H. P. Gibbs, chief engineer, government of Mysore, Province Bangalore, India; Douglass Burnett, general manager, United Electric Light and Power Company, Baltimore, Md.; A. C. Eastwood, engineer, Electric Controller and Supply Company, Cleveland, Ohio; William Amzi Dick, designing electrical engineer, Westinghouse Electric and Manufacturing Company, Pittsburg, Pa., and Edward Jerome Cook, chief engineer, Cleveland Electric Railway Company, Cleveland, Ohio.

Chicago Branch of the Institute Resumes Its Meetings.

On Tuesday evening last the Chicago branch of the American Institute of Electrical Engineers held its first meeting of the season at the rooms of the Western Society of Engineers. Peter Junkersfeld, local honorary secretary, presided. James Lyman presented the report of the nominating committee, the other member of the committee being George A. Damon. The report was adopted, and the following-named gentlemen were elected as the executive committee of the branch for one year: P. Junkersfeld, H. H. Wait, K. B. Miller, H. M. Brinckerhoff, A. D. Lundy, J. R. Cravath, Prof. P. B. Woodworth, Prof. C. E. Freeman and E. B. Clark. It is the intention to have three members retire from this committee each year. A vote of thanks was given to George A. Damon and T. P. Gaylord, retiring members of the old local committee.

James Lyman read an informal paper, illustrated by lantern-slide pictures, giving "Observations of European Lighting and Railway Practice," the result of a recent vacation tour. Mr. Damon gave an abstract of the New York paper of O. S. Lyford, Jr., and W. N. Smith on "Problems of Heavy Electric Traction." There followed a brief discussion, in which Mr. Junkersfeld, George H. Lukes, W. G. Carlton, Mr. Lyman and Professor Woodworth took part.

Delay in Invention.

Where an inventor deliberately proceeds to complete one specific form of his invention and lays aside the work on another specific form and no reason appears for this course except that it suited his own personal business affairs, the commissioner of patents holds that in law he is not excusable for the delay, as business convenience does not excuse delay in reducing an invention to practice. The commissioner of patents also holds that an assignee of a half interest in a patent cannot prosecute the application to the exclusion of the inventor; but, on the contrary, the inventor can prosecute it to the exclusion of everyone save the assignee of the entire interest. An assignee of a part interest may be represented by an attorney, who may inspect and obtain information as to the case, but who cannot take action in it.

Problems of Heavy Electric Traction.[1]

By O. S. Lyford, Jr., and W. N. Smith.

The Long Island railroad system has at present two passenger terminals in the city of New York, one at Atlantic Avenue and Flatbush Avenue in the Borough of Brooklyn, and one at the Thirty-fourth Street Ferry in Long Island City, Borough of Queens. When the great tunnels of the Pennsylvania, New York and Long Island Railroad Company are completed there will be a third terminal for the Long Island railroad passenger traffic in the Borough of Manhattan. From the present terminals there branches out an extensive system of through and suburban lines, over which is maintained a train service, both express and local, reaching all parts of the island. In addition to the suburban service into these terminals, there is an interchange of traffic with the Brooklyn Rapid Transit Company at two points, and a connection is to be established between the subway system of the Long Island railroad and the extension of the rapid-transit subway now being constructed between Brooklyn and the south end of Manhattan. The accompanying map (Fig. 1) shows the location of the western lines of the Long Island railroad and the new connections which are to be made.

Extensive plans for the electrification of the suburban service of this road have been under consideration for some years. These plans provide for the immediate adoption of electric traction on the lines emanating from Flatbush Avenue and for a progressive extension of electric traction over all of the strictly suburban routes, as rapidly as the conditions shall justify. On some of these routes the traffic is of a purely suburban nature, providing facilities for out-of-town residents to reach Manhattan and Brooklyn. On other sections the important traffic is an excursion movement to and from New York's great playgrounds at the beaches. For the convenience of the suburban residents, a frequent service in comparatively short trains is to be provided, but for the excursion service comparatively long trains are necessary. As a result, the number of cars per train in this system will vary from one to eight, or possibly 10. The initial service, limited to a maximum of six cars per train, results in 52 types of runs, varying in number of cars per train and distance between stops. On some sections the lines are fairly free from grades and curves, but on others the grades and curves are heavier than would be supposed from a general knowledge of the contour of Long Island. These few statements will indicate in a general way the complex nature of the problem involved in the selection of a suitable electrical system for such a service and in the determination of types and sizes of apparatus to be used. In the working out of large enterprises important details are frequently settled by quite simple processes of reasoning. Even in a complex problem like the one under consideration, some main points may be decided in this way.

(a) The number of cars per train varies from one to six, as stated. Eight or 10-car trains may be desirable at times. Such variations in train length cannot be provided for economically with electrical locomotives. Motor cars must, therefore, be used, and for all except trains of one or two cars, more than one motor car per train is necessary. The multiple-unit system of motor-car operation is, therefore, best suited to this service.

(b) The greatest flexibility for make-up of trains is obtained by making all cars motor cars.

(c) On the other hand, the first cost of equipment and the cost of maintenance and inspection is least if the motor selected is of the largest size practicable, and the number of equipments required is thus made a minimum.

(d) For a miscellaneous service of the character contemplated all trains, both local and express, should preferably be provided with equipment having the same speed characteristics, so that all motor cars are available for all classes of service. (Trains may operate as express in one direction and as local in the other.)

(e) For express runs of this suburban service, averaging not over five miles between stops, a moderately high speed, say, 50 to 55 miles per hour, is found by experience in steam practice to be most suitable. For these runs, therefore, it is essential that the electric trains shall be able to approximate these speeds.

(f) Future development of the service, such as increase in number of stops and decrease in running time, will mean heavier work for the motors. Therefore, reasonable reserve must be provided in the equipment, and consideration must be given to equipment which will make possible a convenient increase in number of motors per train.

The largest motor in general use for motor-car trains is of 200-horsepower nominal rating, two of these being about the limit of motor capacity that can be placed on a track with 33 or 36-inch wheels and a reasonably short wheel base. On the basis of condition (c), this should be the motor adopted, provided the train combinations can be effected satisfactorily with motors of this size. Condition (f) is also complied with by selecting the largest motor practicable, as the number of motors per train in the initial service will then be a minimum.

To meet condition (e), a gear ratio must be selected which permits the operation of trains at high speeds without damage to the equipment. On the other hand, the best starting conditions and least heating effect are obtained with high-gear ratio. The gear ratio should, therefore, be as high as practicable and still permit of the maximum train speeds necessary for the express schedules. Provision must also be made for extra speeds which may occur on down grades. From observation of the existing service it was concluded that it is safe to assume 60 miles per hour as a maximum.

The motor cars of the service are to be new steel cars similar to those adopted for the Rapid Transit subway. For the determination of motor characteristics, trailer cars were assumed to have the same size and weight of bodies. The weights assumed were as follows:

	Motor car.	Trailer.
Seated load	81,000 lb.	60,400 lb.
Standing load	88,000 lb.	66,000 lb.

These assumed weights are in practical agreement with the actual weights of the subway equipment.

The 200-horsepower motor was found to be the proper size for the service of the subway; but the schedule conditions are so different that this in itself does not signify that the same motors are suitable for the Long Island railroad conditions where the distance between stops for most of the local runs is greater than that of the express runs of the subway, and the express runs are longer in proportion. More or less of the usual calculating must therefore be done to reach a decision as to whether the characteristics of the standard motor of this size are suitable for this service or whether a smaller size could be used to advantage.

The operating conditions of a large steam railroad introduce limitations which cut down the possible speed of the motive-power equipment. Many of these are conditions over which the engine man has no control and which do not relate to the nature of the equipment—that is, curves, road crossings, junction points, yard limitations, meeting points on

1. Extracts from a paper presented at the meeting of the American Institute of Electrical Engineers, New York, November 25, 1904. Mr. Lyford and Mr. Smith are electrical engineers of New York city, the former with Westinghouse, Church, Kerr & Co.

single-track lines, time to handle baggage and express matter, etc. There are delays at stations and delays during runs, some of which occur regularly, but many of which are intermittent. Because of the complicated service these delays are greater on the suburban lines of a steam road than usually occur in interurban or elevated electric service. It is, therefore, evident that in the electrical operation of such suburban service the loading of the motors will differ materially from the loading in an ideal run which might be made with the conditions removed.

After considering various methods of providing for these conditions it was decided to make a

FIG. 1. MAP SHOWING PENNSYLVANIA TERMINAL AND WESTERN LINES OF LONG ISLAND RAILROAD.

series of tests of the present steam equipment to determine the speed-time characteristics of the steam trains and the degree to which these characteristics are affected by the local conditions. To this end a test car was equipped with a speed-recording device and runs were made over various routes with this car attached to regular trains. Complete records were obtained of the movement of each train throughout a round trip, and observations made of local conditions which affect speed. These records were carefully analyzed and the results tabulated. In some instances the engineers were requested to make the best time possible; in other cases they were not advised that a test was in progress.

In summarizing these test runs comparisons were made between the average speed between stops as actually attained and the possible average speed if best acceleration had been made for each run. It was found that the ratio of the actual speed to the possible speed without local limitations is from 71 to 91.3 per cent. Even when the engineers were requested to do their best they were able in only one or two instances to exceed 90 per cent. of the speed which appeared from the test to be possible.

From these records were selected the four best single accelerations. Curve sheet Fig. 2 shows the speed-time characteristics of these accelerations. Curve (D) illustrates the general character of record made by the instrument in these tests. This

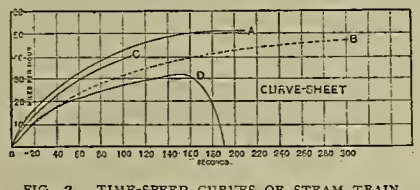

FIG. 2. TIME-SPEED CURVES OF STEAM TRAIN.

run, having been made on a level, conforms exactly with the record obtained. Curves (A), (B) and (C) were obtained on grades, and the actual record has been corrected to illustrate the performance of these trains when reduced to a level. In each case the average acceleration over the run was less than the characteristic shows, but these curves illustrate the maximum that the steam equipment was able to do. The composition of trains and their estimated weights are indicated on the curve sheet. The live load on these runs was so light that it was disregarded. On curve sheet Fig. 3 will be found two curves (E) and (F) of actual runs on grades, compared with run (A) of Fig. 2. According to curve (E) a five-car train on a down grade was accelerated at a rate far below the best performance, and even the three-car train with locomotive No. 35 (curve F) was not accelerated on a down grade with a rate any better than the best single performance on a level.

Curve (A) was made by a locomotive whose weight was 51.5 per cent. of the total weight of train. The officials of the railroad were of the opinion that service equivalent to that which could be performed by this locomotive, No. 59, with only three cars would be sufficient for the electric equipment. The best performance of this locomotive was therefore taken as the criterion by which to work in determining the proper characteristics for the electric equipment. The condition laid down was that the electrical equipment, operating a train with standing load in the cars, should be able to make the same average speed between stops as this particular steam equipment.

Taking curve (A) as a basis, determinations were made of what may be termed the "speed-limit" for steam trains. This is a curve indicating the average speed in miles per hour between stops with the rate of acceleration corresponding to curve (A), without coasting, and with a braking rate of 1.5 miles per hour per second.

Obviously to make the same time the speed characteristics of the electric equipment selected for this service must be such that the schedule can be maintained with similar speed reserve unless the

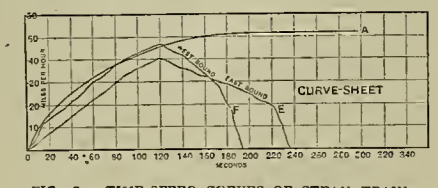

FIG. 3. TIME-SPEED CURVES OF STEAM TRAIN.

limiting conditions are removed. Some of these conditions are being removed and others probably will be. Elimination of grade crossings at roads and junction points, handling of baggage and express matter by special trains, improvement of yard facilities, etc., will make it possible to operate trains at speeds closer to the limit of the equipment. On the other hand, as the population along the road increases the tendency will be to increase the number of stops with as little increase as possible in the running time; therefore it was decided not to make any material allowance for improved conditions in the initial service. The probability of such improvement, however, suggests another precaution to be taken in the selection of equipment, namely, the provision of a suitable reserve in capacity of motors to carry the greater loads which will result from running at speeds closer to the limit.

The electric equipment with the lower-gear ratio has a maximum speed on straight level track of approximately 45 miles per hour, and with the higher-gear ratio 39 miles per hour; whereas the limit of the steam train on the level is 52 miles per hour. For a run of one mile or less between stops, however, the electric train with either gear ratio makes better time than the steam train. For a 1.5-mile run the electric train with higher-gear ratio falls behind the steam train, and at slightly over two miles the electric train with the lower-gear ratio falls behind.

The comparative speeds of these trains are still better illustrated on the speed-limit curves in Fig. 4

The general average length of run between stops for the suburban service is about 1¾ miles. It is evident from the speed-limit curves in Fig. 4 that a three-car electric train with two motor cars and gear ratio 23:59 will average slightly better as to speed than the three-car steam train, but that the same equipment with higher-gear ratio falls considerably below the speed limit of the steam train. From this exhibit it is obvious that schedule requirements indicate that no gear ratio lower than 23:59 should be adopted.

It is also evident from these speed-limit curves that if 23:59 is the lowest gear ratio practicable as determined by the limitations, the three-car train unit will have to be made up of two motor cars and one trailer in order that the requisite speeds may be reached. The weight per motor for this equipment is 30.3 tons, which on this basis of speed requirements is obviously close to the limit.

It is obvious that trains made up into combinations of motor cars and trailers that give less weight per motor will be able to make better speeds than indicated for this three-car train. Furthermore, as the number of cars per train increases the relative effect of head resistance decreases. For these longer trains it is therefore possible that a greater proportion of trailer cars may be used in some instances without reducing the speed limit to such an extent as to prevent the train from making schedule time.

It is not the purpose of this paper to follow out all the technical processes by which final conclusions were deduced as to size and characteristics of motor equipments for the project referred to. Sufficient illustrations have been given to show:

First, that a study of the operating conditions of even a complex project quickly narrows the selection of motors down to one or two sizes, and that these conditions also largely determine the speed characteristics of the equipment; secondly, theoretical methods are now developed to a point of sufficient accuracy to be considered reliable for purposes of selecting equipment; thirdly, short methods may be

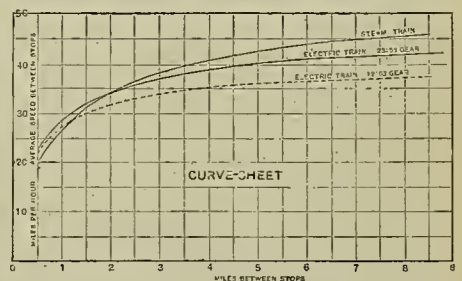

FIG. 4. SPEED-LIMIT CURVES OF ELECTRIC AND STEAM TRAINS.

used with discrimination at least for preliminary determinations.

Discussion (in Abstract).

L. B. Stillwell, New York: A point to which I have never seen attention called is the fact of the average adhesion of the two wheels of a truck equipped with motors; that where the average, we will say, is 20 per cent., the weight upon the two wheels is unequal, is never equal, whatever the average adhesion assumed may be, owing to the tendency to tip the truck. That is to say, the force of the two motors is applied in a horizontal line, passing through the center of the axle.

H. Ward Leonard, New York: One of the first points that the electrical engineer would like to have information on in considering the possibilities of trunk-line electric traction is the amount of horsepower which would be required, and upon that subject it is extremely difficult to get very much information from any data that has been published thus far. However, making the best effort to arrive at approximate accuracy on the basis of the few tests that have covered a sufficient range in the case of steam locomotives to give us some rather definite ideas, I have arrived at the approximate figure that the steam railways of the United States as a whole have about 125 horsepower per mile of line. That is, if you take the maximum horsepower of the steam locomotives and add them all together and take that as the basis of the horsepower I have arrived at a figure of 125 horsepower per mile of line. In the case of the Pennsylvania Railroad this figure seems to be something in the neighborhood of 550 horsepower per mile of line, and in the case of some other roads, as the Pittsburg and Lake Erie, or the Bessemer and Lake Erie, which have very heavy freight service, from the very insufficient data I have at hand I have estimated roughly that the horsepower in those cases reaches as high as 1,000 horsepower per mile of line.

One thing that I wish to speak of in connection with electric locomotives as against steam locomotives is as to the probable first cost. I think there is a practically universal opinion as far as I can discover that the electric locomotive will be a very expensive locomotive with regard to first cost. I do not think that is correct. The steam locomotive of the latest type and largest power will cost, if you consider the locomotive and its tender, taking the entire weight, about five cents per pound; but the only part of that weight which is in useful service is

the weight upon drivers, and when we consider the weight upon drivers the cost of locomotives figures nine cents per pound. Now with the price per pound which has been reached in electric generators I think that it cannot be doubted that in the case of the heaviest locomotive, where the amount of the horsepower will be relatively low compared with the weight by comparison with the high-speed passenger service, that we can make an electric locomotive as a whole to sell for less than nine cents per pound when they have been brought to such a standard as to enable us to get manufacturing processes down to a reasonable figure. It seems to me that the question of the application of the electric locomotive is a question which is largely dependent upon the horsepower per mile of the service which the electric locomotive can replace, and I believe personally that in such cases where there is 250 horsepower employed per mile of line that the electric locomotive can replace the steam locomotives with a very decided economy. The cost of equipping a steam railway of that character complete with the necessary central-station transmission line and locomotives I think would not be far from about 15 per cent. added to the existing capital of the railway, and the very great increase in starting torque and power upon grades will give such a pronounced advantage to the electric locomotive, also the reduction in the cost of fuel, and particularly the very great reduction which will be met with in the cost of maintenance will be very strongly in favor of the electric locomotive, all combining to make the electric locomotive a very certain and strong rival of the steam locomotive in cases where we reach any such power as 250 horsepower per mile of line.

In this connection it may be of interest to say that in the case of the most modern types, the largest sizes of freight locomotives, the cost of maintenance per mile is as much as the cost of the fuel per mile. That is a most startling statement and one which at first sight seems almost impossible, but it is a fact that $3,500 per annum is the cost of fuel and $3,500 per annum is the cost of maintenance on locomotives of the heaviest type such as the 2-10-2 type of Santa Fe locomotives.

Mr. Smith: With regard to the points brought out by the various speakers, Mr. Stillwell brought out the particularly interesting point about the adhesion matter, which has been apparently overlooked to a great extent, and I will simply call the attention of the Institute in that connection to the very interesting paper on braking, by Mr. Parke, who is connected with the Westinghouse Air-Brake Company, which gives results almost exactly the converse of what Mr. Stillwell suggests, of what happens when the brakes are applied to a motor truck.

Mr. Lyford: It was hoped that this paper would bring out a full discussion of methods; in this particular at least the results have been quite flattering. In the paper it was not intended to cover all the phases of the engineering necessary in selecting motors—simply a few illustrations were given bearing upon the points which we desire to make. No attempt has been made to disparage the admirable work done along purely theoretical lines. We desired simply to correct some impressions which have been given. There is no particular claim made to originality. The literature as a whole is lacking in evidence of the character given, however. No doubt other members have such data which would be of great interest to the Institute, data such as we have given, but it has not been produced. The literature is not complete as it should be in that line. Furthermore, it is submitted that whereas recent proceedings of the Institute have given much practical information regarding transmission line, pole-line construction, lightning protection, etc., much information of a similar character regarding experiences in electric traction could be furnished and would be of great value. The plans of the Railway Test Commission, if carried out, will add materially to the literature on the subject, but we do not know just what these results are to be.

Contributed discussion by N. W. Storer of Pittsburg: A reduction of 25 to 30 per cent. in the maximum current required to accelerate a car means on many systems a reduction of the sub-station capacity by the same amount. This is certainly a very decided improvement. Practically the same scheme may be adopted on elevated and subway lines to cut down the fluctuations provided the acceleration in series can be increased. In any case we would favor accelerating at the highest safe rate in series and reducing the current in multiple as much as the schedule will permit. This may be accomplished by the use of two current-limit switches—one for series and one for parallel—in which case the two currents may be made anything desired.

Another question which is agitating the minds of railway people, which has already been mentioned in the paper under discussion, is the lack of margin for making up lost time possessed by the electric-railway system. It is true that the only way a margin can be allowed for on the direct-current system as at present used is in gearing the motors for a much higher speed than required for the regular speed, thus allowing for a much longer coasting line, so that for ordinary service the motors have the power cut off long before the stopping point is reached. This is not as efficient and requires larger motors than are necessary for the usual service. About the only way to avoid this difficulty, and a method which would probably be possible only for locomotive work, would be the use of a booster outfit or a few cells (say 25) of storage battery on the locomotives which could be thrown in series with the line current, or to boost the voltage of the line in case an excess power is required. The power required for high speeds would thus be saved in accelerating. This is a complication which would not be desirable in many cases, but is about the only possible means for increasing the maximum speed. It offers a comparatively simple method for obtaining several efficient speeds.

The single-phase system possesses a marked advantage in this respect, since the type of control best adapted for this system is the voltage control, which enables any voltage within practical limits to be applied to the motor. It is practically independent of the voltage on the line and in this respect is even more flexible than the steam locomotive.

Two-wire System for Train Operation.

A patent was recently issued to H. H. Cutler of the Cutler-Hammer Company of Milwaukee, covering a radically new system for controlling motor-driven cars, operated on the so-called multiple-unit plant. The unique feature of this invention is the fact that both the direction and speed of the driving motors installed on the entire train are controlled by means of but two small wires running the entire length of the train, and by the use of a controller of about the same size as a standard field regulator for a three-kilowatt generator.

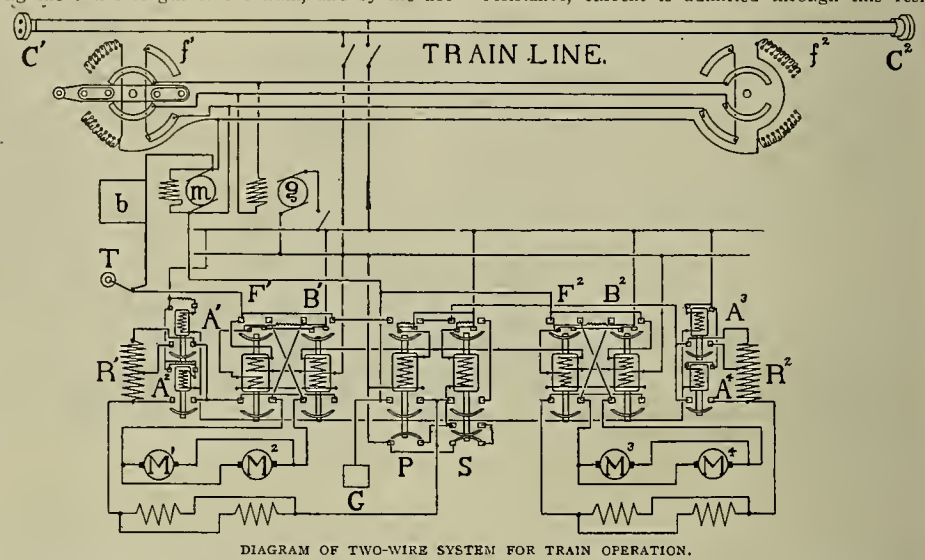

DIAGRAM OF TWO-WIRE SYSTEM FOR TRAIN OPERATION.

The two wires constituting the train line are attached at each end of the car to automatic couplings (C') (C²), which enable the cars to be shifted either end to, thus requiring no attention in coupling up, so far as the electrical equipment is concerned. The maximum current carried by the two-wire train line is the output of a three-kilowatt 110-volt generator when used in connection with six cars equipped with four motors on each car, capable of developing 300 horsepower per car, or 1,800 horsepower per train of six cars. Each car may be equipped with a three-kilowatt motor-generator (M g), shown in the accompanying diagram, capable of controlling the speed of the motors of the entire train, or by another method each car can be equipped with a one-half-kilowatt motor-generator, capable of controlling the speed of its own car only. The direction of travel of the train is controlled absolutely in accordance with the direction of the current flowing in the two-wire train line, and the speed of the train is controlled by the voltage of the current impressed upon the two-wire train line. These wires are utilized for supplying the necessary current for energizing the windings of a number of solenoid switches, which control the current supplied to the driving motors (M') (M²) (M³) and (M⁴), mounted on the trucks.

The two driving motors on each truck are treated practically as one motor, but are provided with an independent solenoid reversing switch (FB) and two solenoid accelerating switches (A) for cutting out the starting resistance (R). Two other solenoid switches (S) (P) are also employed for connecting the motors on one truck, either in series relation with the motors on the other truck or in parallel relation, in accordance with the speed desired. The method of operating the reversing switches in accordance with the direction of the current flowing through the two-wire train line is quite simple. Each solenoid used on the reversing switches (F) (B) is provided with two windings. One of these windings is permanently connected between the trolley (T) or third rail and the ground (G). The other winding is permanently connected to the train line. The winding on the forward solenoid reversing switch (F) is wound left-handed and the winding on the back-up solenoid reversing switch (B) is wound right-handed. It is evident, therefore, that when the current is flowing in the train line in one direction, it will assist the winding of one of the solenoid switches and neutralize the action of the other solenoid winding, so that the desired solenoid switch will be energized in accordance with the direction of the current flowing in the two-wire train line. The windings of the accelerating solenoids and the series and paralleling solenoids are wound to actuate their plungers at different voltages. The operation of the system is briefly as follows:

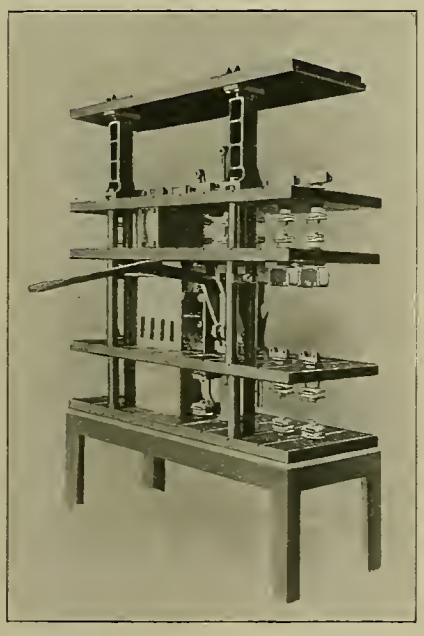
Suppose that each car is equipped with a three-kilowatt motor-generator (M g). At each end of the car is installed a three-kilowatt field regulator (F) having a double set of resistance buttons and segments. An ordinary three-kilowatt 110-volt starting box (b) is also provided. The operator first starts the three-kilowatt motor by means of this starting box. He then moves the field-regulator lever (F') in the direction in which it is desired to move the train. When the lever of the field regulator makes contact with the first step of the resistance, current is admitted through this resistance to the shunt field of the three-kilowatt generator (g), thereby causing it to impress a voltage on the two-wire train line of, say, 20 volts. This voltage is sufficient to supply enough current to energize the forward reversing solenoids (F') (F²), and causes them to lift their plungers, assisted by the current taken directly from the trolley or third rail. The same voltage also supplies sufficient current to energize the winding of the series solenoid switch (S), which attracts its plunger and closes the circuit of the four driving motors (M') (M²) (M³) (M⁴) in series relation. The operator then moves his three-kilowatt field-regulator lever to the second notch, which increases the voltage on the two-wire train line to, say, 40 volts, which is sufficient to energize the first of the solenoid switches (A') (A³) for cutting out the first step of starting resistances (R') (R²). The operator then continues to advance the three-kilowatt field-regulator lever, thus gradually increasing the voltage on the two-wire train line, until finally the second step of resistances (R') (R²) is cut out. The paralleling switch (P) is then energized and the starting resistances (R') (R²) reinserted, which resistances are then again cut out, until the driving motors are finally operating in parallel relation at full speed. The only wires which run the entire length of the car are the two train wires, capable of carrying about 30 amperes and the four-wire cable connecting the two three-kilowatt field regulators, and capable of carrying a small fraction of an ampere in each wire. The solenoid switches controlling the driving motors are assembled in two sets near each truck, so that only four large wires are necessary for connecting the motors on the two trucks in series or parallel relation.

A second method, not shown in this particular patent, has been made the subject of another patent, and installs a one-half-kilowatt motor-generator on each car and varies the voltage of each generator by varying the voltage of the train line. In this case the train line carries current sufficient only for energizing the fields of six one-half-kilowatt generators at 500 volts, or about six-tenths of an am-

pere, the field windings being adapted for 500 volts and the armature windings having a maximum of 110 volts for supplying the various solenoid windings on each car. It will be noticed that there is absolutely no operator's switch in the train line circuit, and that the system is totally different from methods employing a multiplicity of wires running the entire length of the train, and utilizing each wire to energize some particular set of solenoids. The system has a still further advantage in employing a low voltage on the solenoid windings, as well as on the controlling wires. It is possible to control the entire train by means of one wire, using a rail return, but two wires are preferable for practical work. It is also true that it is practically impossible for the operator to too rapidly accelerate the train, for the reason that the potential of the generators used will not respond instantly to changes in the energizing current of their field magnets when designed with this feature in mind. In practice, therefore, the operator has merely to move his controlling lever to the full-speed position, and the train will smoothly and rapidly acquire full speed without further attention.

Cellular Switch Gear for Central Stations.

A good deal has recently been written and said concerning the safety of high-tension switch gear, but considering the importance of the subject too much attention cannot be given to it. A description is here given of the work of Messrs. Walker and Hodgetts of Salford, England, who have set themselves the practical task of demonstrating improvements in the construction of switch gears of the type which has in the past been universally appreciated for use in central stations; particularly upon single-phase systems of 2,000 to 3,000 volts. The accompanying picture shows the new system. The improvements consist of some simple detail alterations to the fuses, with several objects in view, among which may be mentioned the avoidance of



CELLULAR SWITCH GEAR FOR CENTRAL STATIONS.

the use of springs, the provision of a new type of flexible conductor inside the pots and also a mechanical method of fixing the fuse wire in order to replace the existing soldered connections.

In the modification of the general construction of the gear the heavy horizontal slates are taken out of the wall and the switchgear is reconstructed in the reverse position, so that what has been the back now becomes the front and vice versa. This is illustrated in the accompanying picture of a trial board. It will be noted that there are four sets of bolts and distance pieces holding the slates together, and it is found that a very rigid self-containing switchboard can be obtained in this way, although in actual practice on a board of the size illustrated six or eight bolts are used. The bolts are cemented into the distance pieces and so the construction becomes as solid as if it were mounted into the wall. It will be seen at once that by this means the switches and fuses are removed from the operator. He is shielded from any possible arcing from these by two thicknesses of slate slabs.

At first sight it is suggested that this method introduces a back which has hitherto been absent from the type of gear in question, but on afterthought and inspection it will be found that the objection to a back is practically removed in that it is possible to see from the station any person at the back through certain portions of the gear. Moreover the fittings at the back are now shielded in identically the same way as those visible at the front in the original design. G.

Pyro-electrolytic Furnace.

Production and control of temperatures by electric heat within the range above the maximum temperature available for combustion and below that of the electric arc are accomplished by a new device recently patented by Charles P. Steinmetz of Schenectady, N. Y.

In carrying out the invention Mr. Steinmetz makes use of the fact that many refractory materials—such, for example, as refractory oxides, silicates, wolframates, chromates, etc.—are of comparatively high resistance at ordinary temperatures, but increase in conductivity when heated, their conductivity increas-

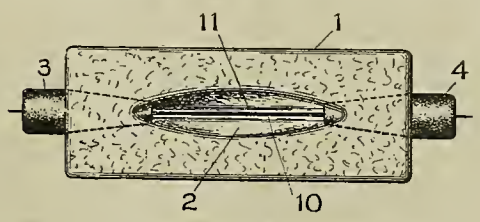


FIG. 1. PLAN VIEW OF PYRO-ELECTROLYTIC FURNACE.

ing with the temperature. Such conductors are designated by the term "pyroelectrolytes." By exposing such pyroelectrolytes to a difference of potential and heating them by some means to a suitable temperature they become conducting, whereupon current commences to flow, giving rise to heat, the degree of which may be regulated or maintained at any desired point by correspondingly regulating the amount of energy expended in heating the pyroelectrolyte. The temperature at which these substances become conducting depends upon the substance, some requiring very high temperatures—as, for example, the pure oxides—while others, as the alkali silicates, become conducting at comparatively low temperatures. In making use of this feature for the purpose of electric heating the substance to be heated is exposed either directly or inclosed in a vessel of very refractory material to the heat generated in a mass of some chosen pyroelectrolyte.

In its practical application the invention is capable of numerous modifications.

In the diagrams, Fig. 1 is a plan view of an electric furnace, and Fig. 2 is a sectional view.

Where comparatively small quantities of material are to be heated it is convenient to make the furnace out of a block or blocks of pyroelectrolytic material either hollowed out or formed with a depression for containing the substance to be acted upon. In the particular arrangement shown a block of pyroelectrolytic material is indicated at (1) and is provided with a depression having a horizontal section approximately elliptical, such as is indicated at (2), the depth of the depression being greater at the middle portion than at the ends.

The terminals through which the electric current is conducted to the furnace consist of some suitable material—such, for example, as carbon—formed into blocks fitted into openings communicating with the retaining recess or cavity for the material to be heated. The carbon terminals are indicated at (3) and (4) and are conical in shape and engage with corresponding openings in the opposing ends of the block (1) of pyroelectrolytic material. Current is transmitted to the terminals (3) (4) by a suitable conducting circuit, indicated diagramatically by the lines (5) (6), connected in series with the secondary (7) of a step-up transformer. The primary of the transformer has its winding subdivided so that either a greater or a less portion of its length may be included in circuit with the primary supply mains (8) (9), thereby offering a means for varying the electromotive force impressed upon the terminals of the furnace. The means thus indicated for varying the electromotive force, and consequently the current supplied to the furnace, are merely by way of illustration, and it will be evident that any other suitable and appropriate means for performing this function may be employed.

As has already been stated, the pyroelectrolytic material forming the walls of the furnace is practically a non-conductor when cold, so that in order to cause current to flow it is necessary that some means for initially heating it should be provided. There are various arrangements which are suitable for this purpose. Thus, for example, heat may be applied to the furnace walls from some external source as by means of a blowpipe or some similar source of intense heat. It is convenient, however, to produce the initial heating of the pyroelectrolyte by arranging some refractory conducting material between the terminals of the furnace and either close to or embedded in the pyroelectrolyte. In the diagrams are shown a small rod or filament (10) of carbon extending between the terminals (3) (4) and embedded within a recess (11) in the bottom of the cavity (2).

In starting the furnace a suitable difference of potential is impressed upon its terminals, heating the filament (10) and so communicating heat to the adjacent pyroelectrolyte, which becomes conducting, and current from the source commences to flow, giving rise to a degree of heat determined by the difference of potential impressed upon the furnace.

In furnaces of this character the phenomena taking place are widely different from those occurring in methods of heating by the electric arc. In an arc furnace—such, for example, as a carbide furnace—the potential gradient or drop in voltage along the heated space is comparatively low as compared with the potential gradient or drop in voltage in a pyroelectrolyte heated by the electric current, the potential gradient in the carbide or similar furnace being of the magnitude of 10 volts per inch as compared with 1,000 volts per inch in the pyroelectrolytic furnace above described. This large potential gradient by giving rise to the possibility of a large expenditure of electric energy in a confined space explains the capability of the pyroelectrolytic furnace for producing extremely high temperatures.

By the operation of the invention temperatures can be produced and maintained from the relatively low temperature of fusible alkali silicates, as glass, up to the extremely high temperatures of fusible orthosilicates of alumina, etc., and chemical reactions produced at these temperatures.

A further application of the invention would be for melting refractory oxides and silicates, as those of alumina, etc. When melted in the arc, no clear and transparent products can be secured, since the

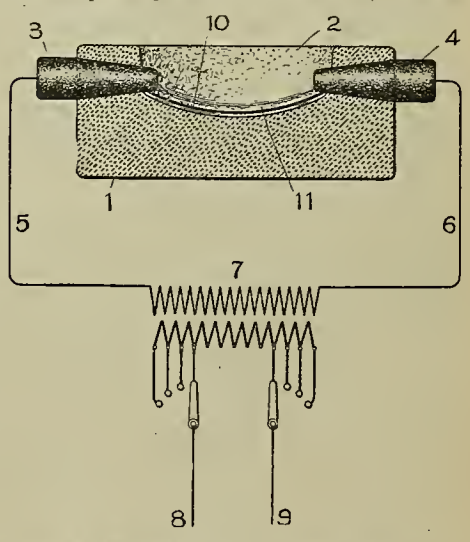

FIG. 2. SECTIONAL VIEW OF PYRO-ELECTROLYTIC FURNACE.

temperature of the arc is beyond the boiling point and at the dissociation temperature of these substances and the resulting mass is thus filled with air bubbles and partly dissociated. By raising to, however, and maintaining the temperature exactly at or slightly above the melting point of these substances they can be fused satisfactorily.

Most precious stones, as the topaz, sapphire, emerald and ruby, are alumina or aluminum silicate more or less colored by foreign material. Others are oxide and silicate of beryllia and zirconia. It has been found by experiment that by heating aluminium silicate by this means it fuses to a transparent mass, colored yellowish in the present instance by impurities and of the nature, hardness and composition of topaz, and it has been possible by the use of small traces of chromic oxide and cobaltic oxide to get green and blue transparent masses of the nature of emerald and sapphire.

The Spokane Southern Traction Company, promoted by M. F. Mendenhall of Spokane, Wash., has increased its capital stock from $500,000 to $2,000,000, and now proposes to build a trolley line to Colfax. The system as planned will rival the Graves project in the same field.

WESTERN ELECTRICIAN

EVERY SATURDAY.

PUBLICATION OFFICES:
510 Marquette Building, · CHICAGO.
TELEPHONE, MAIN 1746.

Eastern Office, 193 Times Building, New York.
Telephone, 3806J Cortlandt.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the **old address** as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own.* THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

REMITTANCES.—All checks, drafts and other remittances should be made payable to the order of the publishers, the **Electrician Publishing Company,** and addressed to the offices of publication, Suite 510, Marquette Building (204 Dearborn Street), Chicago, Illinois, U. S. A.

DATES AHEAD.

American Society of Mechanical Engineers (annual meeting), New York City, December 6th, 7th and 8th.

Electrical committee of the Underwriters' National Electric Association (annual meeting), 32 Nassau Street, New York city, December 7th.

Interstate Independent Telephone Association of America (annual convention), Auditorium Hotel, Chicago, December 13th, 14th and 15th.

SUBWAY ventilation is attracting as much attention in New York as though it had not been threshed over in London, particularly in the case of the steam underground railways, for the last 30 years. Londoners testify that the atmosphere in the tunnels used for steam-railroad traffic is never good, and on a foggy day is usually very bad. Indeed, persons unaccustomed to it are apt to be greatly oppressed by the combination of smoke and fog and frequently experience an earnest desire to get to the open air at the first stopping place. And yet, with all, discomfort and not serious danger seems to be the menace of the vitiated atmosphere. It is therefore quite unlikely that any serious trouble due to lack of oxygen will be encountered in the operation of the New York subway, and if it should be necessary, electrically-operated exhaust fans may be easily installed.

WE received lately a notice from Laundry Workers' Union, No. 22, of Chicago, announcing a forthcoming lecture course. A leaflet accompanying the note set forth that this trades union believes in the "Chautauqua idea" and in systematic reading. The plan is called "spare-minute education," and the subjects of three lectures announced were "Education All Through Life," "An Illustrated Journey Through Germany and Belgium," and "The People's Part in Public Improvement." It is of further interest to observe that Laundry Workers' Union, No. 22, is composed of women, for so we infer from the fact that the officers are women. These progressive laundry girls are to be heartily commended on their manifest desire for intellectual improvement. They have set a good example for labor organizations composed of men in the electrical and other industries.

WHAT threatened at one time to become a dispute of serious proportions between electrical interests in Denver and Colorado Springs for the privilege of entertaining the National Electric Light Association has been settled to the apparent satisfaction of all hands by the selection of both cities. The meeting will be known as the Denver-Colorado Springs convention. The arrangement is that the business sessions shall be held for three days in Denver, and thereafter the delegates and visitors will be taken to Colorado Springs for two or three days of sight-seeing and social intercourse. Thus both cities will participate in the benefits of the convention, if the plan outlined is followed by those who attend. To do so will make a considerable demand on the time of the eastern men, considering also the time consumed in railroad journeys, but as Colorado will be virgin soil to many of the visitors and as this will be the first Rocky Mountain convention of the association, it is earnestly hoped that the official programme will be observed.

HEAVY electric traction of a class to which the proposed electrification of the suburban service of the Long Island railroad belongs involves problems in the calculation of motor sizes, gear ratios, train weights, acceleration, etc., which do not occur as important factors in the design of ordinary interurban lines. The paper presented by Messrs. O. S. Lyford, Jr., and W. N. Smith to the American Institute of Electrical Engineers last week upon "Problems of Heavy Electric Traction" is full of interest. It is devoted to some of the engineering questions which have arisen in the planning of the electrification of the suburban service of the Long Island road. The paper, besides laying before the reader the present status of this work, explains some of the methods followed by the designers to get away from the purely theoretical methods of going about the necessary calculations which are usually employed, especially those relating to train acceleration. In order to do this test runs made on the Grand Rapids, Grand Haven and Muskegon railway and on the Detroit, Ypsilanti, Ann Arbor and Jackson railway in Michigan were observed, and the results of these tests were plotted in the form of curves. By comparing these curves with plotted curves from theoretical formulas it was sought to obtain a verification of the accuracy of all the elements entering into the calculations.

The authors of the paper have evidently put much thought and work upon it, with the object in view of arriving at some simple method of predetermination in the handling of problems of heavy electric traction. While the work which they have done is excellent and will be welcomed by engineers generally as a source of information, it is still open to the criticism of the purely theoretical man who attacks such problems by the aid of old and tried formulas, and who will no doubt say that the theoretical methods which the authors appear to disparage, after all, give results but little removed from the results as shown by the actual tests as recorded in the paper.

Owing to lack of space, only extracts of the paper and discussion can be given in the Western Electrician. These appear on other pages, the parts which are given being selected as having a direct bearing on the work thus far done on the electrification of the road, without considering in detail the methods followed.

UNLESS there be an extension at the last moment, this week marks the passing of the Louisiana Purchase Exposition at St. Louis, for it is announced that the books of the Exposition Company will be closed on December 2d. The event is of more than fleeting interest, as it is probable that it will be several years before another great international exposition is held in the United States. There will be other expositions, of course—the Lewis and Clark Centennial Exposition at Portland, Ore., under the presidency of Mr. H. W. Goode, a former electrical man of Chicago, is scheduled for 1905—but present indications are that there will be a long breathing spell before another world's fair, or universal exposition, such as those of Philadelphia, Chicago and St. Louis, will take shape in this country. And this prospect is not to be regretted. The exposition idea has been worked pretty thoroughly within the last dozen years, at least in the central and eastern parts of the country, with several minor exhibitions and two great ones; and if there is a long interval of relief, exhibitors and visitors, now exposition-surfeited, will return to the arena, perhaps a decade hence, like giants refreshed.

While the total attendance at the St. Louis Exposition has been a disappointment to the management, in that it is considerably less than the number that had been hoped for, it is gratifying to learn by an official announcement that the Exposition Company has settled its accounts with the various banks and trust companies, as well as with the United States government, and that it now has no bills payable on its books save for comparatively insignificant current accounts. Therefore, it seems assured, the balance will be on the right side when it is finally struck. Probably there will be no return, or only a slight return, on the capital stock, but at any rate the Exposition has maintained itself, which is more than some croakers would admit a month ago.

But it is not to the profit-and-loss account that one must look for the value of expositions. In the language of the lamented McKinley, they are the time-keepers of human progress. And in this view, the St. Louis Exposition has, on the whole, worthily fulfilled its mission. It has been a great exposition, planned on magnificent lines; and if the execution fell something short of the plan, it did not do so in any essential or vital particular. The aim—the educational idea—was high and fine; the performance, if not up to the very highest degree of excellence in all departments, was good; and if the whole undertaking was not carried through with precise completeness in all details, it was because so much was attempted, while it is also to be borne in mind that any shortcomings were more noticeable by reason of the very richness and fullness of so many of the multifarious human activities represented at the exhibition.

Electrically considered, the Exposition did not reveal many novelties. The foreign exhibits of electrical machinery, too, were rather scanty. The 3,000-horsepower gas engine from abroad that many electrical men hoped to see did not appear; neither was anything heard, apparently, of the effort that was to have been made to transmit electric power, to the extent of a tenth of a horsepower, through space, without wires. But the lighting effects were striking, and there was a display of American electrical apparatus that was creditable as a whole and in some respects brilliant. It is to be remembered that the electrical exhibits were viewed by many more non-electrical than electrical visitors, and it was admirably planned for the educational benefit of the former class.

St. Louis will witness the close of its fair with varied feelings, no doubt. Not every hope was realized; but the people of that city will have the satisfaction of knowing that the Universal Exposition of 1904 was great in conception, beautiful in design and worthy in execution.

Metric Measurements.[1]

By Alexander Siemens.

One feature of electrical measurements has contributed more than anything else to the rapid rise of the industry, and that is the adoption of the same units of measurement in all countries. The idea of such a system originated with Prof. Wilhelm Weber of Göttingen about 70 years ago, but the British Association for the Advancement of Science has the honor of having taken the first step to realize the proposal of Weber by appointing a committee to suggest practical electrical units. This committee, after due deliberation, chose as the basis of its system the centimeter, the gramme, and the second, and I should like to know why they chose the metrical units, unless they had convinced themselves that these were the best for the purpose. At that time (1861) there was no question of international units, nor had the metrical system been adopted as universally as it is now; all the more weight ought, therefore, to be attached to the decision of this committee, which consisted of eminent scientific men and prominent engineers, so that both the theoretical and the practical aspects of the question were kept in view during their deliberations. Certainly there is no doubt about the beneficial effect of the adoption of this system by all countries, and I have no recollection of ever hearing that the decimal division adopted in it has given rise to any difficulties. It is true some modifications have become necessary, which were discussed and accepted at a series of international congresses called for the purpose, but so far as I am aware nobody has ever suggested that it would be to the advantage of any country to start a system of electrical units of its own. In spite of this favorable experience we all know that there exists still an obstinate resistance against the general introduction of the metrical system into this country, although it has been shown over and over again that the reasons advanced for this obstruction are based on fallacies and are opposed to the experience of other countries. Such an attitude is very largely due to want of practice with a thoroughly consistent system of weights and measures. In this connection it is significant that all engineers who have had to deal for any length of time with metrical measurements, unhesitatingly prefer them to the English want of system. I am of course aware that some prominent engineers profess to have tried to work with metrical units and have been unable to work as quickly and easily with them as they could with their accustomed units. About them one is tempted to say that their conclusion in this particular matter is about as reliable as that of a man who tries to skate, and after his first attempt gives it as his opinion that you cannot move faster by skating than by walking. Another big outcry is raised against the metrical system on account of the great disturbance of all business transactions that would result from the change of weights and measures, and appalling figures are marshalled as to the expense of giving effect to it. It does not appear that other countries have been ruined by discarding obsolete weights and measures, nor should the expert opinion of the inspectors of weights and measures be ignored, who unanimously consider the introduction of the metrical system to be a pressing need to put an end to the existing confusion, and advocate in addition that such an introduction should be made compulsory. The very same thing has been recommended by two or three parliamentary committees after hearing innumerable witnesses for and against the change. Why should such well-considered opinions be calmly ignored, and why should the bogie of expense be trotted out before the public when the real sentiments of the opponents about the disturbance of trade, caused by a change of weights and measures, are disclosed by the fact that they themselves advocate a revised British system based on the inch, the introduction of which would have the same disturbing influence as that of the metrical system, but would lack the advantage of making the international metrical system the universal one? For it cannot be doubted that the example of Great Britain would immediately be followed by the British colonies and by the United States, so that the whole community in all civilized countries would enjoy the same advantages as the electrical engineers already possess.

Against this argument the opponents of the metrical system usually point out that even in France some instances can be found where the old measures are used in preference to the metrical ones, but on examination it turns out that only the old names are preserved in some districts and in some trades, but that in reality the measures in use are based upon metrical units. The few exceptions are only proving the rule, and it would be as wrong to say that the metrical system is not universally used in France or Germany as it would be to contend that English is not the language of the United Kingdom, because you can find people in some remote parts who do not know that language. As a last resort the expense of changing the screwthreads is urged against the change to the metrical system, and the Continental practice of calling their system "Whitworth Thread" is considered an incontrovertible proof that the metrical screwthread is impracticable. If all taps and dies and leading screws had to be exchanged at once it would certainly be a costly affair, but such a measure is not likely to be adopted, as no advantage could result from it. For the real difficulty with screwthreads is that giving dimensions on paper is not sufficient to insure that the screws, manufactured according to such instructions in different works, are really interchangeable. This subject has been investigated by a committee of the War Office, and its conclusions throw a very interesting light on the controversy. In its opinion it is only possible to obtain interchangeable screws if the leading screws by which they are made have all been cut on the same screw-cutting lathe, or are at least cut on benches which are fitted with a leading screw manufactured on the original bench. If another link is interposed differences in the screw turned out become perceptible. As a consequence of the finding of this committeee a screw-cutting lathe has been set up at the National Physical Laboratory, where leading screws for screw-cutting lathes are to be manufactured. The same experience has been made in other countries, where nominally "Whitworth's Threads" are used. It is not possible to make screws interchangeable by prescribing their dimensions; the only way is to obtain taps and dies or leading spindles cut by the same tools. If it is not a case of extreme accuracy there is no difficulty in cutting English thread by means of a metrical leading screw or vice versa. By using a wheel with 127 teeth on the driving-axle an accuracy of 1:6350 can be obtained, which is sufficient for ordinary purposes. In any case it is much to be regretted that such a useless encumbrance of our daily life and such an obstacle to foreign trade as the English system of weights and measures has not yet been abolished.

1. Part of a presidential address to the (British) Institution of Electrical Engineers delivered in London on November 10, 1903.

Electricity and the Contractor.

By Howard S. Knowlton.

Anyone who takes the trouble to compare the methods of modern building construction with those of but a few years ago cannot but be impressed with the increasing number of labor-saving plans and devices which have been adopted by progressive contractors. A very few minutes observation of almost any large office building, hotel or store in its early stages of development is all that is necessary to demonstrate the extent to which the division and systematic control of labor have been carried by the contractor in charge of the work. Much still remains to be done, however, along the line of displacing unskilled labor—or better, releasing it for other work—by mechanical or electrical methods of accomplishing the required result.

Close observation of general engineering and building construction, railroad maintenance and allied activities brings to light the fact that muscular power can probably never be entirely eliminated in the organized work of the world. Selective intelligence cannot be superseded, but it is important to constantly study the problem of putting the machine in the laborer's place. It is not always realized that unskilled labor is a heavy expense in large industrial enterprises, because the wages of the individual are far from imposing. At five per cent. interest, however, the capitalization of an unskilled laborer earning $1.50 per day, or $450 per annum, amounts to $9,000. If he can be replaced by a machine whose interest, depreciation, taxes, repairs, insurance and power cost per year runs up to 20 per cent., there will be a financial saving up to $2,250 investment. A case in point is that of the contractor who pumps out his excavation by hand, generally using two laborers to the pump, even though he employs arc and incandescent lamps at night to enable the work to be pushed hard and fast. It is hard to see why motor driven pumps are not installed when the power circuits are available at many points on the job, particularly as the first cost of such an outfit would probably not exceed 2½ per cent. of the $4,500 which it will pay to spend to do away with each pair of laborers engaged in pumping. This reasoning naturally applies with greater force to large undertakings than to small, because it does not pay to make elaborate preparations for doing a simple piece of work.

The inefficiency of the ordinary steam engine used for hoisting has long been realized by contractors, but its great range of usefulness has until lately enabled it to do its work under all sorts of conditions with little or no competition. Recent experience with electric power, however, has shown that where current is available at reasonable cost, say from 10 cents per horsepower-hour downward, it is a great mistake not to consider the advantages of the newer methods before beginning an extensive piece of work. The electric hoist uses power only when it is in actual operation, and then takes power in close proportion to its load; its efficiency far exceeds that of a wasteful donkey engine in point of fuel consumption; it is frequently capable of more work with the same attendance than the latter can accomplish; it often has a greater field of usefulness than the steam engine, and it is cleanly, practically noiseless and always ready for immediate use. At night it can be used in the most fastidious residence section without causing the slightest disturbance. Being light in weight, it can readily be transported to any part of the work and may raise itself from one floor of a building to another.

The steam boiler of the donkey engine must be kept fired all day and in cold weather during the night as well. The exhaust of the engine often frightens horses; the smoke and soot begrime everything animate and inanimate within the neighborhood, and the fire risk is always present. The premises are bound to be characterized by smoke, steam, ashes, coal dust, leaky pipes and more or less water. It has been said with truth that the steam engine works by day and the electric hoist by the piece. The latter may present a slight fire risk if it is improperly wired, but in operation this risk is insignificant. The compactness and portability of the electric hoist make it possible so to locate it that the operator is always within sight of his work. In underground work the economy, reliability and safety of the electric hoist increases with leaps and bounds in comparison with other methods. Steam engines are simply out of the question in mines which are operated with regard to efficiency, freedom from danger and steady, continuous service.

The electric hoist may be so mounted on the mast of a derrick that the distribution of the load as well as its raising and lowering is entirely under the control of a single operator. Thus the control of the machine equals or excels the accuracy with which a steam engine may be operated in such service, and it is entirely free from the jerky motion which is commonly found in the latter machine as used in contract work. Here the uniform torque throughout the entire revolution of the motor armature works to the distinct disadvantage of the reciprocating engine just as it does in the acceleration of rapid-transit railway service. This nicety of control gives the electric hoist a notable value in such work as placing stone and handling heavy steel girders.

In lumber yards or on wharves the motor-driven hoist finds a sphere of continual usefulness. Mounted on a truck, it is easily moved from place to place, and it possesses many advantages for the loading and discharging of vessels. Within a building the electric hoist can be used inside the most expensively finished rooms long after the air-befouling and begriming donkey engine has been obliged to evacuate the premises. When the hoist is so placed that the operator can see the work which is being done, it is often possible to swing the piece into place in less time than it would require to get the signals to an engineer so located that he cannot see all that is going on. Furthermore, the electric hoist used in connection with derricks can readily be so mounted that it will serve as a partial counterweight and thereby lessen the strain on the derrick and guy ropes. When the hoist is mounted so as to swing with the boom and thus enable the operator to always face his work, a notable increase in capacity is obtained. In determining the relative economy of steam-driven and electric hoists, the proper basis of comparison is the cost of operation for a given amount of work handled rather than the cost per day or per month. Often contractors adhere to the donkey engine because electric power is not available at some suburban or outlying point where the building under consideration is to be erected. This drawback will disappear as the extension of commercial power circuits becomes greater and as central-station men realize the amount of new business which awaits exploitation in the hoisting field as well as in other phases of contracting. The induction motor is so well suited to hoisting that the limitations of direct-current transmission no longer apply. Pile drivers, stone crushers and other machines are equally applicable to electric driving.

An operation frequently encountered in contract work is the tearing down of old buildings. Probably in the majority of cases the brick and stone walls are demolished by gangs of laborers working with pick and shovel. Here the old question of muscle at $1.50 or thereabouts per day per man, vs. machinery, comes in, and there would seem to be a chance for economy through the use of electric or pneumatic rock drills in helping the slower picks in the work of destruction. Still another gain in efficiency arises from the use of double ladders for up-and-down travel, which saves considerable time in the course of a month. The portable telephone and the megaphone likewise should prove useful.

Transformer for Thawing Ice in Water Pipes.

Thawing ice in water pipes by electricity, a subject which has been under discussion since 1899, but which has created renewed attention during the last year, promises to be a paying business for central stations located where severe winters are common. Last winter a few companies tried it in a more or less experimental way, and reports have been made showing the profit in the work. Illustrated herewith is a transformer outfit designed and

TRANSFORMER FOR THAWING ICE IN WATER PIPES.

built by the Pittsburg Transformer Company of Fittsburg for this particular service.

The outfit consists of a transformer, as shown in the picture, adapted to operate on any circuit of approximately 1,100 or 2,200 volts and 60 or 133 cycles. The transformer will deliver a current of 300 amperes continuously, or currents of about 600 amperes for periods of half an hour.

On the back of the transformer are mounted a heat indicator and a choke coil. The heat indicator consists of a section of lead pipe connected in series with the transformer, and the temperature which this assumes is a guide as to the heating of the pipe under treatment. The choke coil consists of a few turns of heavy copper bar with a movable laminated-iron core. When this plunger is pushed entirely into the coil the transformer secondary may be short-circuited, but no more than normal current will flow.

The object is to send current through the frozen section of pipe. One secondary lead should be connected to the pipe inside of the house and the other lead connected to a nearby hydrant outdoors, or to a pipe inside of a neighboring house.

The transformer is connected to the primary line in the usual way, altering the connections on the porcelain terminal block, if necessary, to adapt it to the line voltage, as shown on tags attached to the transformer.

Any standard fuse block may be used to protect the transformer. These are fused with a 20-ampere fuse for 1,100-volt circuits or with a 10-ampere fuse for 2,200 volts.

The hand is kept on the heat indicator and the plunger pulled out little by little until the indicator is hot enough. Water will usually begin to flow slowly in five or 10 minutes.

One of the advantages of this outfit is that it weighs but 235 pounds.

Gas Engine Adapted for Heavy-duty Electric-light and Power Work.

Embodying many distinctive points of value and representative of the most advanced gas-engine practice in Europe, the Cockerill gas engine, herewith illustrated, will be of particular interest to electrical engineers who have to do with electric-light and power stations.

The gas engines of this system, which are handled in this country by the Wellman-Seaver-Morgan Company of Cleveland, Ohio, are of the well-known four-cycle type, in which only one impulse caused by the combustion of the gaseous mixture takes place during one stroke of the complete cycle, or in two revolutions. The engine acts as a pump as well as a motor. The gas mixture is drawn in during the first (forward) stroke and compressed during the second (return) stroke, exploded in the third (forward) stroke and exhausted in the fourth (return) stroke. This action takes place on each side of the piston, as the cylinders are built double-acting. A view of the engine is shown in Fig. 1.

Taking up the various parts of the engine separately, the design of the cylinders presents the following important features:

Owing to the considerable differences in temperature occurring in the cylinder, it is necessary to provide for free expansion, and this is obtained by supporting the cylinder in a cradle, one end only being attached to the main girders of the engine bed. The power of each end of the cylinder is transmitted directly through the girders to the engine frame, as the two heads of each cylinder are connected by through-going bolts, and the power developed in the back end of the cylinder is transmitted through these to the front end. The cylinder proper is therefore not subjected to the stresses incidental to power transmission.

The pistons are steel castings in one piece and secured to the piston rod by means of a collar and nut. No taper is used on the rod, and the wedge action caused by tightening the nut, and thereby tending to split the piston, is avoided. A special feature of the engine is the water-cooled piston-rod nut, which is an additional preventive to premature ignition. The pistons do not bear in the cylinders, but are supported outside the cylinders by cross-heads.

All valves of each cylinder end (see Fig. 2) are operated by a single cam; therefore, in a four-cylinder double-acting gas engine there are only eight cams in all. The valve gear though performing the regulation of the mixture in a perfect manner, is of the greatest simplicity, and consists of only a very few parts in motion. The side shaft (SH), driven by the engine shaft and making one revolution to two of the latter, because of the four-cycle principle, carries a cam (C) for each cylinder end. This cam serves for operating both the inlet and outlet valves. The cam revolves in the direction indicated by the arrow (1). When the lobe of the cam begins to act on the roller (r) the latter and the rod (T) rise, the lever (B) oscillates, and its end (b) descends. This movement causes both the mixing valve (M) and air valve (L) to open. The latter, which is fixed to the mixing valve (M), uncovers the air ports (A). The moment of opening these valves corresponds exactly to the dead-center position of the piston at the beginning of the suction stroke. In the first part of the suction stroke, air only is therefore drawn in. The double-beat gas valve (V) concentric with the mixing valve, remains closed. It is operated by the lever (D), whose outer end (E) engages with the latch (F) of the lever (G), when the inlet valves are on their seats. During the opening of the mixing valve the spring cap (H), fastened to the mixing-valve stem, compresses the spring (S), as the spring cap (I) on the other end is fastened to the hollow stem of the gas valve, which, being blocked by the latch, remains closed. The connection (K) and its parts act as a link of variable length between the levers (B) and (D). An eccentric (Q) on the side shaft (SH) operates a small cam (m) by means of the rod (T'), the oscillating lever (N) and the rod (O). The center of oscillation of lever (N) is variable and under the control of the governor, and the effect of the displacement of this center is similar to a change of the length of the rod (O). The cam (m) operating on the roller (P), secured to the end of the lever (G), disengages the latch (F) at a definite moment predetermined by the governor, and the gas valve (V) opens quickly, the amount of opening being limited by the space between the piston and the bottom of the dash-pot cylinder (K). The proportions of the lever (B) and (D) are such that the opening of the valves (V) and (M) and also the slide (L) bear a fixed relation with one another. From the moment of the opening of the gas valve, which corresponds to a certain predetermined position of the piston during the suction stroke, air and gas in proper proportions are admitted so as to give a good mixture. Whatever, therefore, the moment of cut-off may be, the proper quantity of gas and air for a good mixture is admitted. The two valves and the slide remain open until the end of the suction stroke. At this moment while the roller (r) descends on the lobe of cam (C), the large spring (R) closes the mixing valve and the air slide, and the link (K) returning to its original length, transmits the descending motion of (B) to (D), and closes the gas valve (V). A small spring (s) is introduced, so as to permit the mixing valve (M) to continue its motion and seat itself should the valve (V) touch its seat before (M) can close.

The piston on its return stroke compresses the charge, the inlet and outlet ports of the cylinder being closed; but as the variable quantity of mixture followed a certain volume of air and completed the 100 per cent. of cylinder volume, the best mixture remains close to the igniters, located in each cylinder head, and therefore firing is assured, even with smallest load.

A little before the dead center corresponding to the end of the expansion stroke, the lobe of the cam (C) touches the roller (t) and acts by means of the rod (U) and the levers (W) and (X) upon the exhaust valve (Y), opening the same. This valve remains open during the exhaust stroke (second return stroke of the piston), and is closed on the dead center corresponding with the beginning of the next suction stroke by means of the spring (Z), which acts at all times to close the valve, and presses the roller (t) against the cam (C).

GAS-ENGINE ADAPTED FOR HEAVY-DUTY ELECTRIC-LIGHT AND POWER WORK.

Electric Automobiles for Express Service in Washington.

Members of the board of directors of the Adams Express Company were recently in Washington, D. C., and directed that electric automobiles be installed in the delivery business in that city. Ten machines were immediately put into service, and a few days' trial in this capacity has convinced the management that business can be carried on with greater dispatch and at a less expense than by the horse-drawn vehicles. Eventually the company will have between 30 and 35 machines in use in Washington. They will be operated by the company's own men, who are being trained by experts. The automobiles being used by the company were manufactured by the Lansden Company of Newark, N. J. Each machine weighs 3,000 pounds, has a capacity of one ton and is equipped with a 60-cell Edison battery of the ferro-alkaline type. The company has set aside a large portion of its stable on B. Street, which will be used as a garage. This garage has a charging station with a switchboard capable of accommodating 18 machines.

Possible Waterpower Developments in Missouri.

Messrs. E. Johnson, Jr., and F. W. Hanna, engineers of the United States Geological Survey, have recently examined three springs in Missouri, and Mr. Johnson has submitted a report on the possible development of waterpower from each spring. They are Greer Spring in Oregon County, Alley or Big Spring and Blue or Round Spring, both in Shannon County. The report will undoubtedly interest many people.

Greer Spring is located in the north-central part of Oregon County about 1½ miles south of Eleven Point River, eight miles northeast of Alton, the county seat of Oregon County, and 16 miles due south of Winona, Shannon County. It derives about one-fourth of its water from an underground stream which emerges from a cave in a high limestone bluff and three-fourths from the so-called "boil," 100 feet distant and seven feet lower, the source of which is unknown. It rises at the head of a deep and narrow valley, through which it flows in a rapid descent to Eleven Point River.

On September 30th the engineers ran a line of levels from the water surface at the top or cave exit of the spring to the water surface in Eleven Point River and return. They found an almost uniform fall, amounting in all to 53.94 feet. There are numerous points at which dams could be built, as solid rock for foundation work and abutments is plentiful. A stone and timber dam developing a fall of about nine feet is already in existence on this stream. By means of a horizontal turbine and endless wire rope it transmits power to a large grist mill located at the top of the valley about 200 feet above.

A gauge was established by which the flow was determined to be 362 cubic feet per second at a gauge height of one foot. The discharge was found to be 265 cubic feet per second at a gauge height of 0.72 foot. No storage could be developed here. At times of minimum flow, which is not far from 265 cubic feet per second, a head of 54 feet can be developed without backing the water over the spring. When Eleven Point River is at a high stage this head fall would be correspondingly decreased, but the flow of the spring is then greater, as it changes more or less with the rainfall, and probably at least 20 feet more head could be developed without injury by backing water over the spring.

The minimum discharge (265 cubic feet per second) and the minimum fall (54 feet) will give 1,626 horsepower, gross, or (using 80 per cent. efficiency) 1,301 horsepower, net.

Alley or Big Spring is located six miles west of Eminence, the county seat of Shannon County, Mo. It emerges at the base of a high sandstone bluff located on the side of the comparatively broad valley of Jacks Fork of Current River. After flowing a distance of about one-half mile it discharges into Jacks Fork.

Conditions are such that a dam could be built only at the head of this spring, where there is at present a small stone and timber dam which furnishes power for a grist and sawmill. On October 2d Messrs. Johnson and Hanna ran a line of check levels from the present surface of the spring above the dam to Jacks Fork and found the total fall to be 17.24 feet. Both spring and river were then probably at their lowest stages. On the side of the high bluff north of the spring's outlet a flume leading from the dam to the river could be economically built. By means of this flume and of turbines placed near the river the fall noted—17.24 feet—could be nearly all utilized. The engineers also determined that the discharge of the spring at its lowest stage is 85 cubic feet per second.

No storage could be developed here. A dam of considerable height might, however, be built at the site of the present one, provided no injury resulted from the backing of the water. This dam would need to be semicircular in form and 300 or 400 feet long at its crest, the length depending on its height, which could be from 10 to 70 feet.

Without raising the water in the spring above its present level, 164 gross horsepower, or 131 net horsepower (using 80-per cent. efficiency), could be developed. This would probably be the minimum power during the year and the maximum during the summer months.

Round or Blue Spring is located 14 miles northwest of Eminence. It is situated at the bottom of a natural well about 50 feet in diameter, one side of which is formed by a high bluff. Through an opening on the other side, 18 feet below the surface, the spring flows out and discharges into Current River, which is about a quarter of a mile distant.

The engineers ran levels from the surface of the spring to the surface of the water in Current River and found the fall to be only 3.87 feet. River and spring were then at a very low stage. The flow was at that time only 23 cubic feet per second.

No storage can be developed here and no opportunity is afforded for building a dam. By sealing up the opening in the well, however, the water of the spring could be made to rise and overflow the top, thus giving the stream a total fall of 22 feet to the river. With the help of this fall 57 gross horsepower, or 46 net horsepower, could be produced. This would probably be the minimum power developed during the year and the maximum during the summer.

Waterpower could probably be developed at numerous places on Eleven Point River. Near Greer, Mo., the river has a flow of 31 cubic feet per second. Current River also offers many chances for the development of waterpower. At a point 200 feet above the entrance of Round or Blue Spring its flow was found to be 411 cubic feet per second.

Convention of District Managers of the Westinghouse Company.

During the week ended November 19th the district managers of the Westinghouse Electric and Manufacturing Company gathered at the works at East Pittsburg and discussed plans and methods for the coming year. These conventions are annual occurrences and are productive of great good, bringing together men from all parts of the United States whose experiences are the natural outgrowth of conditions under which they labor.

Those attending the convention were Calvert Townley, general agent, New York; G. Pantaleoni, general southwestern manager, St. Louis, Mo.; R. L. Warner, New England agent, Boston, Mass.; E. W. T. Gray, New York; D. E. Manson, Boston, Mass.; W. S. Heger, San Francisco, Cal.; F. B. H. Paine, manager export office, New York; C. W. Underwood, Buffalo, N. Y.; C. F. Medbury, Detroit, Mich.; G. B. Dusinberre, Cleveland, Ohio; W. F. Fowler, Baltimore, Md.; C. A. Bragg, Philadelphia, Pa.; M. P. Randolph, Seattle, Wash.; S. J. Keese, Los Angeles, Cal.; P. N. Jones, Pittsburg, Pa.; D. E. Webster, St. Louis, Mo.; T. P. Gaylord, Chicago, Ill.; L. M. Cargo, Salt Lake City, Utah; J. R. Gordon, Atlanta, Ga., and T. J. McGill, Minneapolis, Minn.

On Wednesday evening the management gave a banquet to the visiting managers, at which all of the executive officers of the company were present.

A feeling of optimism was evidenced throughout the convention regarding the business situation and the prospects of continued prosperity throughout the country.

W. S. Heger of San Francisco stated that the outlook on the Pacific Coast was never better, work being plentiful and money easy. "Mining projects in California are flourishing," he said, "and they appear to have plenty of money behind them. This insures large installations of Pittsburg electrical machinery."

L. M. Cargo of Salt Lake City said that the election of Roosevelt had given a decided impetus to mining development in Utah, Arizona, Nevada and New Mexico, capital, which prior to that had been timid, being induced to pour money liberally into dormant investments.

J. R. Gordon of Atlanta, Ga., said: "The South will soon have the greatest boom of its history. For the last two years the cotton crop, the barometer of southern prosperity, has been phenomenal. Business conditions reveal a greater stability and the increase of manufacturing in the South is extraordinary. Abundant waterpower, easily available, will prove an enormous boon and a producer of business for Pittsburg."

F. B. H. Paine, manager of the export department, remarked: "The outlook for foreign business has never been more promising for American manufacturers, because never before were Europeans more alive to the superiority of American manufacturing methods. Pittsburg apparatus always has the preference because of its superiority."

C. A. Bragg of Philadelphia said: "The outlook for general industrial activity was never brighter. While there has been plenty of capital during the last year, timidity over unsettled political conditions prevented its investment. Lack of confidence has disappeared and hopeful buoyancy is observable everywhere."

The views expressed by E. W. T. Gray of New York were to the effect that: "New York suffered severely the last year because of building strikes, but these have subsided and business has been good there for six months. It is a foregone conclusion that it will be even better, as cheap money is abundant, and there is no lack of financial support for any legitimate enterprise."

WESTINGHOUSE DISTRICT MANAGERS AT PITTSBURG.

The following list of names refers to the accompanying picture, which represents most of the gentlemen in attendance at the convention:

1. E. W. T. Gray.
2. D. E. Manson.
3. C. W. Regester, manager, Cincinnatt, Ohio.
4. C. B. Humpbrey, manager, Detail and Supply Department.
5. Charles A. Terry, secretary and attorney, New York.
6. Frank H. Taylor, second vice-president.
7. W. S. Heger.
8. F. B. H. Payne.
9. G. B. Griffin, assistant manager, Detail Supply Department.
10. C. W. Underwood.
11. Charles F. Medbury.
12. J. E. Johnston, manager, Dallas, Texas.
13. George B. Dusinberre.
14. R. L. Warner.
15. L. A. Osborne, fourth vice-president.
16. S. L. Nicholson, manager, Industral and Power Department.
17. James C. Bennett, auditor, East Pittsburg, Pa.
18. M. P. Randolph.
19. Calvert Townley.
20. J. R. Gordon.
21. C. S. Cook, manager, Railay and Lighting Department.
22. W. M. McFarland, acting vice-president.
23. C. A. Bragg.
24. S. J. Keese.
25. W. F. Fowler.
26. C. F. Scott, consulting engineer.
27. Walter Cary, manager, Sawyer-Man Electric Company, New York.
28. S. H. Anderson, credit manager.
29. N. S. Braden, sales manager, Canadian Westinghouse Company, Hamilton, Canada.
30. F. H. Shepard, engineer on unit-switch control.
31. P. N. Jones.
32. S. E. Webster.
33. L. M. Cargo.
34. T. J. McGill.
35. G. Pantaleoni.
36. F. F. Rohrer, correspondent, main office.
37. J. W. Sterns, Mountain Electric Company, Denver.
38. A. Goodby, correspondent, main office.

Ohio Telephone Notes.

All the subsidiary companies of the Federal Telephone Company made a gain for October over last year. The Cuyahoga made the best showing, the gain in gross earnings being $7,000 and in net earnings $3,500. The company also made a reduction in fixed charges and increased the surplus for stock. The United States Company's comparisons for September of this year with the corresponding month last year are also good. The Federal companies are making excellent progress.

Probate Judge Jones has granted the Middletown Home Telephone Company a franchise to operate a system in Middletown, with privilege to string wires and build conduits in certain portions of the city.

Telephone apparatus was arranged on the rostrum of the Baptist Church at Delaware on Thanksgiving day and many people who could not find room at the church listened to the sermon over the wires. This is the first time the telephone system has been used for church services in that old college town.

The Stafford and Marietta Telephone Company of Marietta has been incorporated with a capital stock of $10,000 by George W. Robinson, A. G. Hughes and others.

Owing to the death of Judge James M. Thomas the Portsmouth Telephone Company of Portsmouth has been reorganized by the election of the following officers: President, I. S. Grimes; vice-president, Joseph S. McKell, Chillicothe; secretary and treasurer, Dr. W. D. Temper; general manager, E. E. Knox.

Toledo telephone offices will hereafter hold long-distance operators responsible for all toll bills that may be incurred, it is said. The operator must collect in full for each message or the amount of shortage will be taken from her salary. The companies have also made a rule that operators shall not call for individuals, but instead the number of the telephone only.

City Solicitor Butler of Columbus has refused to draft an ordinance regulating the construction of pole lines for telephone, telegraph, lighting and heating companies until the board of public service furnishes in the rough the ideas to be incorporated. He declares he is not an electrician and that this work should devolve upon someone who knows something about it. After the matter is prepared, he says, he will then reduce the ordinance to legal phraseology. C.

Telephone News from the Northwest.

A telephone company has been formed at Odin, Minn., to build local and rural lines.

The rival telephone lines at Marion, S. D., the Hofer and the Steninger systems, have consolidated, Dr. Hofer purchasing that portion of the Steninger system which is in Marion. The two systems will be continued as the Marion Telephone Company.

Charles O. Ryan of Eldora, Iowa, has been named receiver for the Hardin County Telephone Company, operating exchanges at Eldora, Ackley and Steamboat Rock, Iowa.

Work has been started rebuilding the local exchange for Wheaton, Minn.

The Anson Telephone Company of Anson, Wis., has been formed and will establish a local system, connecting with the long-distance lines of the Wisconsin Telephone Company.

The Farmers' Telephone Company of Litchville, N. D., has been formed.

The Southwestern Minnesota Telephone Company seeks a local franchise at Westbrook, Minn.

The telephone system at Auburn, Iowa, has been placed in commission.

The Emmet County Telephone Company, which has been voted a franchise at Estherville, Iowa, will begin work at once on its new system, and expects to have the line in operation by spring.

The Council Bluffs (Iowa) Independent Telephone Company has filed articles of incorporation with $100,000 capital. E. H. Lougee was elected president and F. J. Day secretary. Work will be started at once on a new system at Council Bluffs.

The Eldon (Iowa) Telephone Company will improve its system extensively this winter. About 5,000 feet of new cable will be installed.

The Yellowstone Park Telegraph and Telephone Company has completed its new line as far as Bozeman, Mont. R.

Michigan Telephone Matters.

The Citizens' Telephone Company of Marshall has increased its capital stock from $15,000 to $50,000.

The Michigan State Telephone Company has a large gang of men at work in the city of Marshall making improvements to the plant. The Citizens' Telephone Company recently purchased the local Independent exchange, which it is operating. The Bell company is putting in telephones free until 300 subscribers are secured.

It is understood that the Michigan Telephone Company, in fighting the Independent Telephone Company of Ypsilanti, is pleased with the action of the City Council in voting that the Independent company remove all the conduit material it has on the streets and on public property. The bond which the company has promised has not yet arrived, and the manager at Ann Arbor states that the material will be removed to private property for the time being, but asserts that the plant will be installed. W.

Indiana Telephone Items.

The New Long-distance Telephone Company is building a direct line between Bloomington and Bedford.

There is a strong probability of the Cumberland Telephone Company securing a franchise in Evansville. Mayor Covert has called a meeting of the City Council, city officials and representatives of the telephone company, with a view to settling the telephone question. No intimations have been made as to what the final outcome will be or as to what stand the city will take when the matter comes up for discussion during the conference. The company has made overtures, offering $2,250 for a 25-year franchise. It is generally believed that the city will be able to settle the question on much better terms than that offered by the company. The public will be invited to the meeting, and the hope prevails that the wrangle and litigation which have retarded developments for years may soon be ended by an equitable settlement of the franchise question.

The success of the department of telephone engineering in vogue at Purdue University, in charge of Prof. J. C. Kelsey, has caused, it is said, the Ohio State University and the schools of technology of the East to think seriously of opening similar departments soon. Applications have been received at Purdue by men who want to take the two-year course in telephony, but this is refused them because the department would become crowded with special students. The study is only a part of the course of electrical engineering. Juniors and seniors may take telephony in pereference to steam-engine and boiler work. There are now 25 in Professor Kelsey's class, and the prospects are for a much larger class next year. There is quite a demand for Purdue students as experts to take charge of telephone lines and exchanges. S.

Use of the Telephone in Reporting Football Games.

A good illustration of the use to which the telephone may be put in reporting football games was given in Chicago at Marshall Field on the occasion of the game between the teams representing Northwestern University and the University of Minnesota on November 19th. The Northwestern Telephone Exchange Company of Minneapolis, 425 miles from Chicago, received the reports of the game during its progress. These reports were given to the Minneapolis newspapers and bulletined by them for the benefit of the public.

At the Chicago end of the long-distance line connections were made by the Chicago Telephone Company's system with apparatus on the field. The representative of the press who was to report the game walked about along the side lines with an ordinary breast transmitter similar to those used by telephone operators hung from his shoulders. He was also provided with two receivers with headpiece, enabling him to hear better the questions coming to him over the line and also shutting out to some extent the noise of the "rooting." The reporter carried, besides this apparatus, 150 feet of conductor connecting his instrument to a point about the center of the field, so that he was given a range of 150 feet in either direction and was thus enabled to have the play at all times under his direct observation.

The conversation was carried on directly between the correspondent and the Minneapolis exchange, and no trouble whatever was encountered in understanding everything that was said. The arrangement of the apparatus used at Marshall Field was planned by Mr. J. H. Riddel, manager of the Chicago Telephone Company's Oakland exchange.

NEW COMPANIES.

The Georgetown and Camfield Telephone Company in South Carolina has been chartered with $500 capital.

The Chase County Telephone Company of Champion, Neb., has been incorporated with a capital stock of $10,000.

The Sampson Telephone Company has been incorporated to build and operate in Clinton, N. C., and has a capital of $20,000.

T. H. Ferris of Utica, N. Y., and business associates have organized the Independent Telephone Securities Company of Utica with a capital of $800,000.

The Auburn Telephone Company of Auburn, Ill., capitalized at $35,000, has been incorporated and will operate a telephone system. The incorporators are W. H. Ramsey, E. R. Conklin and F. W. Kelly.

A company has been formed to build a telephone system in Hamilton, Ga. Fred Miller of Hamilton is president of the company and W. E. Farley is general manager.

GENERAL TELEPHONE NEWS.

C. W. Bartlett & Son have purchased an interest in the Fairbury (Neb.) Telephone Company.

The Phœnix Telephone Company of Texarkana, Tex., will extend its long-distance line to Sherman, Tex.

The Alvin and Angleton Telephone Company of Alvin, Tex., will extend its line to Friendswood in Galveston County.

F. B. McElroy and S. A. Jones have applied to the city of Dallas, Texas, for a franchise to construct a telephone system.

The trustees of Ocean Park, Cal., have sold to W. L. Porterfield a franchise to operate a telephone system at that place, his bid being $550.

The Bell Telephone Company has just completed a long-distance line from Wilmington, N. C., to Mullins, S. C., giving Wilmington eight long-distance circuits.

Articles of merger and consolidation have been filed by the Winchester Telephone Company of Virginia and the Cumberland Valley Telephone Company of Baltimore.

The Colorado Telephone Company of Denver has voted to increase its capital from $5,000,000 to $10,000,000, and will extend its lines to Nebraska, Kansas and the East.

Directors of the Christian County Telephone Company of Ozark, Mo., are contemplating increasing the capital stock of the company for the purpose of improving the system.

Royland Smith of Dallas, Tex., has gone to Palestine, Tex., where he will have headquarters as the new district manager of the Southwestern Telegraph and Telephone Company.

Extensive improvements to its telephone system are contemplated by the Belmont Telephone Company of Wheeling, W. Va. It is proposed to increase the capital of the company from $75,000 to $150,000.

A private telephone system to connect the National Palace, Chapultepec Castle, and the private residences of President Diaz in the City of Mexico is to be installed under the direction of Oliver L. Araiza, an electrical engineer.

The Rainy River International Telephone Company of Canada has been incorporated with a capital of $250,000. The provisional directors are D. Robertson, P. T. Roberts, J. A. Mathieu, H. Williams, P. A. Smith and H. A. Sissons.

The Birmingham (Ala.) Railway, Light and Power Company has made arrangements with the Southern Bell Telephone Company for the installation of a private telephone exchange, which will be put in at once.

The Commercial and Industrial Association of Selma, Ala., has induced the Southern Bell Telephone Company to install the latest improved telephone service in Selma, work to be commenced in the near future.

The Alaska Telephone and Telegraph Company has taken over the Nome telephone system and the Boyd long-distance telephone line at Nome, Alaska. A. E. Boyd has been retained as manager and a number of extensions will be built under his supervision.

The striking telephone girls formerly employed by the Pacific States Telephone Company at Portland, Ore., are busy circulating a petition asking that a competitive company be given a franchise. Members of the Operators' Union generally are engaged in the work and claim to be meeting with encouraging success.

A recent meeting of the Business Men's Association was held in Salt Lake City, Utah, to protest against the prevailing rates of the Rocky Mountain Bell Telephone Company. After listening to a statement from the manager of the telephone company it was decided to make a thorough investigation before definite action be taken.

Steps are being taken to establish a rural telephone system in the county of Waterloo, Ont., Canada, and a company with that object in view is being organized. The system will probably be operated by the municipality of Waterloo. Some years ago there was a farmers' telephone company in the county, but it was bought out by the Bell Telephone Company.

The American Telephone and Telegraph Company recently made the largest express shipment that ever passed through the express office at Norwich, Conn. The company is about to install a circuit from New London to Willimantic and a large quantity of wire, crossbars and miscellaneous supplies for the work was brought to Norwich by freight. Owing to the manner in which the recent storm crippled the telephone service at Troy, N. Y., the company in order to have the system repaired as quickly as possible took the Norwich material and shipped it by express to that city. The consignment weighed 27 tons and it was gathered from various sections of the city over which it had been distributed. The express charges amounted to $550.

Ottumwa Telephone Company Reorganized.

S. W. Crosby of Ashtabula, Ohio, and H. W. Stecher of Cleveland have closed up the business of the Ottumwa (Iowa) Telephone Company by making the transfer of the title to all the property previously held by that company to the Ottumwa Telephone and Electric Company. These gentlemen represent the creditors of the old company who bought it in when it was recently sold. The business has been reorganized and will henceforth be known as the Ottumwa Telephone and Electric Company, of which Mr. Crosby is president and Mr. Stecher secretary.

Howard Herr will be retained as manager and will have full charge of the company's interests in Ottumwa. Under Mr. Herr's direction the business of the company has continuously grown from a small beginning until it now has nearly 1,400 telephones in the city and 700 in the country immediately surrounding. These, with the connections that can be reached through the exchanges in the smaller towns, give the subscribers access to about 15,000 telephones in Wapello and adjoining counties. In addition to these arrangements the line has been entirely rebuilt.

Copper Market.

Recent heavy demands for copper have sent prices soaring. The present market price of 14¾ cents to 15 cents a pound, as compared with 12⅝ to 12¾ cents last September, indicates a striking change. This rise in price has been expected and is the outgrowth of actual requirements in trade. With exports at the rate of 20,000 tons a month for the last 10 months, nothing else could be expected; the foreign demand alone took enough copper to prevent market depression. Expectations of a more active business for next year are not without foundation, supplies being greatly reduced by export. A gentleman prominent in the copper trade for the last 20 years says: "We are just entering a period of development in the copper industry that will surpass anything the metals trade has ever known. Demand for copper, owing both to the immense variety of new uses found and being found for it and the rapid extension of electric traction and the enormous increase in electrical installations of every sort, has way outrun production. Seventeen-cent copper in the immediate future seems certain, and that a much higher range of prices will prevail for a long time to come may be anticipated with confidence."

Telephone Companies Gain a Point in Canada.

The Privy Council of London, England, has given a decision of importance to every municipality in Canada. In the case of the city of Toronto vs. the Bell Telephone Company is was decided that the company has the right to erect poles and to lay conduits without the consent of the city. The Bell company got its charter from the Dominion government. In the Quebec case the question was raised whether the company had the power to operate in the provinces without the provincial consent. The company applied to and obtained from the Ontario Legislature a charter in which was inserted a clause which the Dominion charter did not contain—that the company could not operate on any street without the consent of the municipality. The city of Toronto tried to hold the company to this provision and litigation ensued. Justice Street gave judgment in favor of the city, but this was reversed by the Court of Appeal. The city appealed to the Privy Council, which dismissed the appeal and gave judgment for the company.

Telephone Development in the City of Mexico.

It is expected that the Mexican government will soon act on the plans submitted some time ago by the Mexican Telephone Company for the installation of a central-energy telephone system and the placing of its wires underground in the central portion of the City of Mexico. As soon as the necessary official authority is granted the company will begin the construction of conduits and place an order for the building of a switchboard of the central-energy design.

Jose Sitzenstatter, who obtained a concession from the Mexican government not long since for the installation of a new telephone system in the City of Mexico, has gone to Stockholm, Sweden, to confer with L. M. Ericsson & Co. of that city, who are to finance the enterprise. The terms of the concession require that work must be commenced on the new system within six months from November 1st.

Braking High-speed Trains.[1]

By R. A. Parke.

During a hearing upon an application for a charter for the New York and Port Chester Railroad Company before the New York Railroad Commission some 3½ years ago, the writer was called upon for expert testimony concerning the distance in which electric trains might be stopped, in regular service, from a speed of about 60 miles an hour. It was then that expression was first publicly given to the opinion that the special conditions under which the brakes are applied upon trains of such high speeds warrant a force and promptness of application which could be employed at low speeds only with serious shock and danger of train rupture. For years prior to that time the uniform teaching and recommendation of the Westinghouse Air Brake Company, as given in instruction cars and by authorized representatives of the company, had been emphatically opposed to the use of what is commonly known as the "emergency application" of the quick-action air brake in ordinary train service, and a proposition which contemplated the use of the emergency application of the quick-action air brake, and particularly the more powerful high-speed form of air brake, appeared to the average railroad officer as nothing short of heresy. Members of the railroad commission promptly instituted a line of questions which made it quite evident that they were similarly impressed.

One of the fundamental grounds upon which the New York and Port Chester railroad sought to justify the granting of a charter for a railroad line paralleling a steam railroad already in operation was the materially improved local express-train service which it was proposed to attain through the superior rate of acceleration acquired upon electric trains by the use of the system of multiple control of motors operating upon the axles throughout the train, and the higher rate of retardation to be obtained through the high efficiency of the emergency application of the air brake, in bringing such trains to a station stop.

In presenting the matter to the railroad commission elaborately arranged curves indicating the rates of acceleration and retardation had been prepared by the able engineer, Mr. C. O. Mailloux, which appeared to justify the claims for the improved character of train services contemplated by the company. Although multiple-control systems of electrical train control were at the time in successful operation, it did not appear that the rate of retardation indicated by the stopping curves had been attained in regular service, and the high efficiency of the proposed train service was characterized as impracticable and chimerical by those opposed to the granting of the charter.

It is a notable fact that while the effort to attain high acceleration in bringing electric trains to the required speed had involved costly extension of the application of motors to a number of cars throughout the train—being applied in some cases to the trucks of all the cars—practically no effort had previously been made to realize a higher rate of retardation in regular service than that which had been regularly employed in steam-railroad service through the service application of the ordinary automatic air brake. Without attempting any discussion of the merits of multiple-control systems of electric locomotion, or the commercial limitation of the expense justified in extending the application of motors to a number of cars throughout the train, it may properly be suggested that commercial economy may not result from an indefinite extension of such systems. The inadequacy of a single motor car for the acceleration of a train of several cars easily justifies the application of motors to the trucks of one or more additional cars, depending upon the number of cars in the train; but it may also be readily understood that a point may be reached in the increased acceleration due to multiplication of motors, beyond which the addition of other motors is accompanied by too small a measure of increased acceleration to justify the added expense of installation and maintenance.

An illustration may be found in the operation of city waterworks' systems. It is a well-understood fact that refinement of pumping machinery is justified up to the attainment of a practical duty of somewhere in the neighborhood of 90,000,000 gallons; beyond this, further refinement, whereby an increased duty is accomplished, is attended by an increased cost of plant and of repairs and necessitates a higher grade of skilled oversight and attendance which more than compensates for the fuel economy acquired. It is not fuel economy, but it is commercial economy of operation which defines the limit of such refinement and establishes a duty which may not be exceeded with commercial advantage. Similarly, the extension of multiple-control systems to the application of motors to more than a certain limited proportion of the axles upon a train may easily be attained by an ultimate cost whereby economy of operation is impaired.

The pertinence of the foregoing observation lies merely in the fact that while the application of multiple-control system has in some cases apparently been pushed to extremes in an effort to improve electrical train service by attaining the very highest accceleration at the sacrifice of commercial economy, the absence of any effort to attain a fuller measure of the possible rate of retardation in stopping is the more noteworthy. That materially increased stopping efficiency may with propriety be employed in high-speed train service, it is the purpose of this paper to demonstrate; and, as every start requiring high acceleration is necessarily attended by a corresponding stop in which a higher rate of retardation correspondingly improves the character of the train service, it is obvious that if increased expense is justified in moderately increasing the rate of acceleration, materially increased stopping efficiency at a comparatively small cost is entitled to careful consideration.

To those who are familiar with the results of experiments with the friction of brake shoes upon carwheels and the difference in the conditions of brake application at high speed from those at low speed, the proposal to increase the force of application of the brake shoes upon the wheels at high speeds will excite no comment.

The various trustworthy experiments upon brake-shoe friction have uniformly demonstrated a declining ratio of the friction to the pressure of the shoe upon the wheel at increased speeds. For the same brake-shoe pressure the friction excited at a speed of 60 miles an hour is but about one-half that which occurs when the speed is but 20 miles an hour. Other causes result in a reduction of the brake-shoe friction during continued application of the brakes, and this result combines with the increase of the friction through reduction of speed, during the retardation of the train, to maintain a comparatively uniform though slightly increasing rate of friction throughout the stop until quite near its close. Thus, the average rate of retardation of the brakes, when applied to the wheels at a speed of 60 miles an hour, is about one-half of that acquired with the same brake-shoe pressure when the initial speed is but 20 miles an hour. It is evident, therefore, that the same rate of retardation—which may with entire propriety be employed at all speeds—can only be acquired by increased pressure of the brake shoes upon the wheels to correspond with the reduced rate of friction occurring at the higher speeds.

Moreover, an application of the brakes which will produce a given rate of retardation at one speed without danger to the rolling stock or discomfort to the passengers may also be applied at any other speed with no more danger or discomfort. The high-speed brake was designed more particularly for use upon high-speed trains, and it employs a considerably greater brake-shoe pressure in emergency applications than that of the ordinary quick-action brake to more nearly realize the rate of retardation obtained in the emergency application of the quick-action brake upon trains of lower speeds. At such a high speed as 60 miles an hour, however, even the emergency application does not develop greater brake-shoe friction than does a full-service application of the quick-action brake at a speed of 20 miles an hour. It is true that the service application is attended by a comparatively gradual application of the brake-shoe pressure, while the emergency application develops the greater brake-shoe pressure very quickly; but experience and observation seemed fully to justify the conclusion that the reduced rate of friction at the higher speeds would permit the use of even the high-speed brake without noticeable shock or disagreeable sensation.

Though the conviction thus expressed 3½ years ago was based upon observation, experience and knowledge of the results of experiments upon brake-shoe friction, it was, nevertheless, so far as practical employment in train service was concerned, a theoretical conclusion. Since that time experiments in the use of the high-speed brake upon passenger trains have amply confirmed the writer's views upon this subject, and demonstrated the absence of disagreeable effect as well as the highly increased rate of retardation in employing the emergency application of the high-speed brake for stops in high-speed train service. The time and distance saved in such stops permit the employment of the maximum speed up to a comparatively short distance from the stopping point and cause the train to be brought to a quick, smooth stop in much less than half the time and distance required for an ordinary service stop.

That the shortened running time and increased efficiency of high-speed train service—particularly local express-train service—by the employment of such higher rate of retardation, may be attained at a small fraction of the expense at which a lesser improvement in such efficiency can be obtained through the increased acceleration resulting from extending the multiple-control system from the use of motors upon one-half the cars in the train to their application to all of them seems hardly open to doubt. The neglect to take advantage of this higher rate of retardation would seem to be attributable chiefly to the long-established doctrine that emergency applications must not be employed for service stops under far different conditions. It is to be understood that such a doctrine still applies with all its force to the operation of passenger trains at moderate speed as well as to freight-train service. It is only under the special conditions of uniform operation at high speeds—not less than 50 miles an hour—that the recommendations of a most powerful

1. A paper presented to Section F of the International Electrical Congress at St. Louis. Mr. Parke is special agent for the Westinghouse Air Brake Company.

application of a most powerful brake in all stops properly applies.

In addition to the advantage of effecting a reduction of from 50 to 75 per cent. in the time and distance required by a service application of the brakes, a collateral advantage of material importance is the much greater accuracy of the stop. In a stop by a service application of the brakes, the application is affected by the personal judgment of the operator, whereby an element of uncertainty is introduced which almost invariably requires a subsequent release and a second application of the brakes, in order to bring the train to a stop within the range of the station platform. This frequently involves more or less "drifting" of the train at greatly reduced speed, to avoid stopping short of the station and not infrequently involves backing of the train because of inaccurate judgment in the application of the brakes, whereby the train runs beyond the stopping point. In the use of the emergency application not only is the individual application of every brake, very much more prompt and powerful, but the rate of serial application from car to car is almost instantaneous and is automatically established to the exclusion of any influence of the operator's judgment. Grade and alignment of the roadway, of course, influence the stopping distance; but such influences are readily determined for each stopping point, and the point at which the motive power should be shut off and the emergency application of the brakes should occur may be designated by a post or other permanent signal, whereby the train will be brought to a stop at the desired stopping point.

In comparison with the rate of acceleration in starting steam-railroad trains, the rate of retardation in ordinary service stops has been so high that it is not unnatural that increased efficiency of train service has suggested higher rates of acceleration in starting rather than improved retardation in stopping; but it should now be clear that a really efficient high-speed train service may be obtained only by also employing the maximum practical rate of retardation by which so large a reduction of the time and distance of stopping is counted. Electric train service furnishes exceptional conditions for attaining the maximum retardation as well as the maximum rate of acceleration—though for different reasons. Where trains are drawn by steam locomotives the conditions existing at the locomotive and the variable load carried in the tender involve limiting the braking power so that the retarding force is considerably inferior to that realized upon the cars. Where electricity is employed the motive power is applied directly to the cars themselves in such a manner that the maximum braking efficiency may be obtained as well upon motor as upon other cars, and the whole train is thus subject to the maximum rate of retardation.

While the special conditions of high-speed train service permit realization of the maximum obtainable retardation in ordinary station stops, it will be understood, of course, that all the ordinary means of general brake efficiency are contemplated in connection with the brake apparatus. In a paper presented to the American Institute of Electrical Engineers and published in the January (1903) volume of proceedings, the writer pointed out the more important features of the brake apparatus for attaining such hign efficiency. They included efficient foundation brake-gear automatic slack adjuster to maintain the minimum piston stroke in the brake cylinders, and brake beams hung between the wheels and adapted to regulate the brake-shoe pressure so as to compensate for the transfer of weight from the rear to the forward pair of wheels of each truck during the application of the brakes.

In addition to such general considerations an exceedingly important element of braking efficiency is the character of the brake shoes applied to the wheels. Extensive experiments have demonstrated a very wide variation in the frictional quality of brake shoes of different materials, and, further, a marked difference in the friction of the same brake shoe upon wheels of different materials. It is, in general, found that the maximum frictional resistance occurs in the application of soft cast-iron shoes to chilled cast-iron wheels, and the friction-producing quality generally declines as harder brake-shoe materials are employed. It should not be concluded, however, from this general relation of the hardness of the brake-shoe materials to the frictional quality, that soft material only should be employed in brake shoes. Besides the cost of soft brake shoes, which wear rapidly, the trouble and expense of replacement, together with the complications arising from rapid wear, are highly persuasive elements in favor of the use of harder materials. If the inferior frictional quality of the harder brake shoes is compensated by correspondingly increased pressure of the brake shoes upon the wheels, the operative objection to the hard brake shoe practically disappears. The question is to a large extent a commercial one. Increased pressure upon the harder shoes involves, of course, somewhat increased wear; but when, in each case, the brake-shoe pressure is so adapted to its frictional quality that the maximum retarding friction is acquired, the practical question resolves itself into the relative cost of initial installation and of subsequent maintenance—to which must be added due consideration of trouble and annoyance arising from the necessity of frequent attention.

Within the last two or three years two different series of experiments with the high-speed brake have furnished most interesting and important information bearing upon this subject. In one series soft cast-iron brake shoes were employed with chilled cast-iron wheels. In the other the "Diamond S" form of brake shoe (of hard cast iron, with steel inserts) was used with steel-tired wheels. Otherwise the conditions were fairly comparable, the tests being conducted in the same general locality. In the case where soft cast-iron shoes were employed the initial air-pressure in the brake cylinder was about 85½ pounds, which became reduced toward the end of the stop to 60 pounds. In the tests with the Diamond S brake shoe the initial air pressure on the brake cylinder was also about 85½ pounds, which, by the use of special high-speed reducing valves, became reduced to a final minimum of from about 69 pounds from a speed of 80 miles an hour to about 78 pounds in stopping a six-car train from a speed of 50 miles an hour. Moreover, in some instances a brake-cylinder pressure of 75 pounds or more occurred in applications of the brakes at speeds of 20 miles per hour (and even less) without producing wheel-sliding of an injurious character or exceeding that which occurred with the use of the soft cast-iron brake shoe when the final minimum air pressure in the brake cylinder was but 60 pounds. The stopping distances were phenomenally short in the tests with the Diamond S brake shoe, averaging 602 feet from a speed of 50 miles an hour, 982 feet at 60 miles an hour, and 1,334 feet at 70 miles an hour—the shortest authentic stops on record.

It is true that these tests were made in dry weather and that the rails were more or less affected by sand, in which the soil of the country abounded, and particles of which were carried about by wind. It is very doubtful whether such high-terminal brake-cylinder pressure might be safely employed even with such hard brake shoes under the varying rail conditions of regular service, the corresponding total brake-shoe pressures, as customarily calculated, being from 104 to 117 per cent. of the weight of the braked cars; but these experiments clearly illustrate both the fact that wide difference in the frictional quality of brake shoes should be given proper consideration in determining the brake-shoe pressure, and also the fact that with a properly determined pressure certain forms of hard brake shoes may yield as good, or perhaps even better, average retarding influence than soft cast-iron brake shoes. It is worthy of note that the material in the brake shoes employed in these experiments was so hard that a number of the shoes were broken during the tests—but without apparently affecting their utility, inasmuch as the form of the shoes remained unchanged, the parts being held in place by a steel plate cast in the outer surface of the shoe.

The foregoing considerations assume the use of the automatic air brake. Inasmuch as high-speed trains have been under consideration, no other form than an automatic brake could properly be considered. In the case of a service employing single cars the advantage of an automatic brake practically disappears and more simple forms of apparatus may be employed to advantage; but, where two or more cars are assembled in trains, and particularly in high-speed trains, the necessity of providing for the contingency of train partings permits but the one prudent and safe course of employing an automatic brake, and thus far the automatic air-brake alone has become safely established as meeting all the requirements of service. The necessity of the most efficient high-speed train service requires in addition the most forcible application of the most efficient form of automatic air-brake—the emergency application of the "high-speed" brake.

Ontario Power Company Contracting for the Delivery of Current.

It is announced in a circular issued to bankers and brokers as well as to others likely to be interested in bonds that the Ontario Power Company has entered into a contract with the Niagara, Lockport and Ontario Power Company for the sale of 30,000 electrical horsepower, the same to be delivered at the international boundary line by July 1, 1905, together with an additional 30,000 horsepower to be delivered at the same point by January 1, 1907. The contract is said to run until April 1, 1950, with the right to renew it for a period of 60 years more.

Under the agreement the Niagara, Lockport and Ontario Power Company is to take this power at the international boundary line near the whirlpool where the gorge is narrow, and there a transformer station is to be built. From this point a transmission line is to be built as far east as Rochester, N. Y., by July 1, 1905, the performance of the contract being guaranteed by the forfeiture of a specific sum as liquidated damages in case of non-performance. While the Niagara, Lockport and Ontario Power Company has a franchise to develop power by means of a surface canal extending from the upper river, the circular states that this contract is made with the Ontario Power Company because of the long time it would take to develop power at Lockport. It would thus seem that the possibility of any power development at Lockport is very remote. The contract for power and the construction of a transmission line eastward toward Rochester indicates that transformer stations will probably be erected in Lockport and other places for the commercial distribution of transmitted energy from Niagara.

New Members of the Institute.

The following-named persons are among those elected to associate membership in the American Institute of Electrical Engineers at the directors' meeting in New York city on November 25th:

Adams, Spencer, Lima, Peru.
Alexander, G. R., Central California Electric Company, Sacramento, Cal.
Beaujon, A. R., East Coast Electric Light, Power and Ice Company, West Palm Beach, Fla.
Berry, M. R., Pittsburg, McKeesport and Connellsville Railway Company, Connellsville, Pa.
Carter, H. H., Barbados, B. W. I.
Dunstan, A. St. C., Alabama Polytechnic Institute, Auburn, Ala.
Enström, A. F., Royal Technical Academy, Stockholm, Sweden.
Feilden, T. J. V., Electrical Magazine, London, England.
Flowers, A. E., University of Missouri, Columbia, Mo.
Gaiennie, L. R., Kinloch Telephone Company, St. Louis, Mo.
Goettling, G. M. W., Edison Electric Illuminating Company, Boston, Mass.
Hammond, Robert, Westminster, England.
Harris, W. W., Union Electric Light and Power Company, St. Louis, Mo.
Hesketh, Thomas, Folkstone Electricity Supply Company, Folkstone, England.
Hill, Lucien, West Penn Railway and Lighting Company, Connellsville, Pa.
Lambert, T. B., Chicago, Ill.
Meyer, H. J., Shreveport Gas, Electric Light and Power Company, Shreveport, La.
Moore, W. D., Lima, Ohio.
Morris, D. K., Birmingham, England.
Morse, L. G. E., London, England.
Moses, R. P., Mt. Copper Company, Taylor, Cal.
Newbery, Jorge, Buenos Aires, A. R.
Owen, Llewelyn, Peoria Gas and Electric Company, Peoria, Ill.
Renström, J. A., Reyla Power Plant, Pachuca, Mexico.
Skinner, W. E., Canadian Westinghouse Company, Winnipeg, Manitoba.
Snyder, H. R., Louisiana Purchase Exposition Company, St. Louis, Mo.
Stone, E. W., Asheville Telephone and Telegraph Company, Asheville, N. C.
Strickland, T. P., Sydney, N. S. W.
Walborn, I. G., Telluride Power Company, Provo, Utah.
Webb, A. C., Sydney, N. S. W.

Business Opportunities Abroad.

The electric street-railway system in the city of Salzburg, Austria, is to be extended.

The agents of the city of Shanghai, 63 Leadenhall Street, London, England, will furnish particulars concerning the building at Shanghai of an electric-railway 24 miles in length.

Civil Engineer Alfio Dini of Cremona, Italy, will furnish particulars concerning the erection of large electric works at Cassano. It is also proposed to build an electric railway between Cremona and Milan.

The Licenciado Benjamin Barrios, in the City of Mexico, has received a concession for building an electric railway between the capital and the city of Puebla.

The town of Darjeeling, British India, will introduce electric lighting.

The town of Guirgiu, Roumania, will construct waterworks, and the town of Botoschani an electric-lighting plant.

The municipality of Almendralejo, province of Badojos, Spain, will introduce electric lighting.

The telephone system of Abyssinia is to be largely extended.

Eleven electric cranes are to be contracted for by the city of Ghent, Belgium.

The Association des Industriels de France, No. 3 Rue de Lutèce, Paris, has offered a prize of $1,500 for the best electric meter which is submitted to it by December 31st next.

Prize Design for an Edison Medal.

At a recent meeting of the jury appointed to select a design for an Edison medal commemorating the invention of the incandescent lamp, the competition being under the auspices of the National Sculpture Society, there were present J. Q. A. Ward, chairman; Daniel C. French and Augustus Saint Gaudens, for the National Sculpture Society, with Edward D. Adams and T. C. Martin appearing for the Edison Medal Association and on behalf of the American Institute of Electrical Engineers. After a further examination of the 29 designs submitted in competition, the committee, by unanimous action, awarded the first prize of $1,000 for the successful design, including its execution in such shape and detail as will permit direct reduction to medal size, to Mr. James Earl Fraser. The second prize of $100 went to Mr. Adolph A. Weinman, and the third prize of $50 to Miss Evelyn B. Longman. The successful competitor, Mr. Fraser, has been requested to develop his design for final consideration by the committee.

Farmers near Kalispell, Minn., are reported to have organized the Flathead Valley Railroad Company, which will build electric lines radiating from Kalispell to various parts of the valley. Much of this valley is now without transportation facilities and the electric lines will furnish an outlet for the produce of the valley.

CORRESPONDENCE.

Great Britain.

London, November 16.—After remaining in abeyance for nearly three months the offers made by Mr. Robert Hammond, the consulting engineer to the Dublin corporation, to take over and run the new three-phase station which has recently been erected there, came up for further consideration last week. It will be remembered that in consequence of many antagonistic statements as to the efficiency and capabilities of the works erected under Mr. Hammond's supervision, this gentleman offered to take sole charge of the works for a period of seven years and to sell current to the corporation at 1½d per unit, his remuneration being the difference between 1½d and anything less per unit at which he was able to produce electrical energy. Immediately those individuals who had been loudest in their denunciation of the probabilities of the new works, changed their opinion and argued that if Mr. Hammond could do these things and hope to make a profit, assuredly the corporation could do likewise, and that on no account should the control of the works go out of the hands of the corporation. In the meantime Mr. Hammond has addressed a further communication to the corporation offering it still more favorable terms, or he will take over the entire undertaking for 21 years, paying the interest, sinking fund and depreciation and supplying current at present prices. Therefore when these various proposals came before the corporation for consideration there was a strong muster of members; but probably in view of the later offers of Mr. Hammond the desire to scoff them was not so prominent as it has been since August, when the offer was first made. It is true that the chairman of the electric-lighting committee strongly urged that the offers be rejected forthwith, but after some discussion a proposal to form a special committee of the whole corporation to carefully consider the matter was carried.

The latest information concerning the working of the Lorain surface-contact system of tramways at Wolverhampton is to the effect that during the last 12 months it has been entirely satisfactory and has more than justified its claims for safety and reliability. The maintenance costs are being reduced and there is a strong belief that the total working costs for the present year will be considerably below the average of other towns where the overhead trolley system is employed. There are now 20 miles of single track, while there were only 6½ miles last year, and there are 30 cars in use and 10 more on order. This is distinctly encouraging and it would appear that the system is to be a success in England in spite of, and not because of, the Wolverhampton corporation, having regard to what took place at the end of the 12 months' trial of the system.

Mr. Alexander Siemens of the firm of Siemens Bros. & Co., London, delivered his presidential address to the Institution of Electrical Engineers last week. Mr. Siemens is a prominent member of the Employers' Federation, a body organized in opposition to trade unionism, and it was not surprising therefore that he should have devoted a large part of his address to this matter. His point was that salvation in the future lay in cheapening the cost of production, and that this obtained while the present conditions of employment of labor in England continued to exist. There was not sufficient co-operation between masters and men nor sufficient elasticity in trade-union rules to allow of this being done. Later on in his address Mr. Siemens argued in favor of the adoption of the metric system of weights and measures in this country and adduced much the same arguments as he did two years ago when discussing the matter at the Institution in opposition to the late Sir Frederick Bramwell, who was one of the strongest supporters of the retention of our existing system. The last part of the address was devoted to the question of improving our patent laws. Mr. Siemens disapproves of the system of preliminary search adopted in America and to be introduced here by the new act which comes into force next January. He contends that this should be carried out by the patentee, who is much more able to judge of those patents which may anticipate him. His address raised several controversial points, but as the rule is that no presidential address may be discussed, no one could touch upon them. In all probability, however, a discussion will be in the technical press.

Mr. J. W. Swan, F. R. S., inventor of the incandescent lamps, has been created a knight on the occasion of the king's birthday, and the Hon. C. A. Parsons of steam-turbine fame has been made a commander of the bath (C. B.).

The County Council of London has been trying for many years to secure parliamentary powers for running tramways over the Thames bridges. To foreigners no doubt it seems strange that there are so few means of communication between the north and south of London, but there is a certain section both of the London press and of members of Parliament who habitually oppose any proposal of the sort. At present therefore and apparently for many years to come people coming from the south of London to the city have to disembark on the south of the river and then walk some half a mile or more to their work. Once again, it is true, the council intends to seek parliamentary powers for these tramways, but the present condition of legislation is all against success.

During recent years many large schemes of tramway intercommunication have been constructed in the Midlands and North of England. Another such network has been put into operation in the Leeds and Wakefield district of Yorkshire, and the total length of track will eventually be some 75 miles. In spite of the opposition to running powers by a company over the lines of the Newcastle corporation this new company has already arranged for running powers over the Leeds corporation tramways, and no doubt others will follow as the lines are extended. The company has its own power station, where three-phase current is generated at 6,300 volts, the frequency being 25 cycles per second. The sub-stations, which are at present four in number, are equipped with 200-kilowatt rotary converters. The increase in the number of undertakings such as these will no doubt have an accelerating effect so far as the electrification of our railways is concerned, for the competition now set up by electric tramways is too much for the railway companies to cope with by steam. G.

New England.

Boston, November 26.—The Boston and Providence Street Railway Company, which will build a trolley line of the most up-to-date character between the two cities named, has organized with the following board of directors: George K. Webster, North Attleboro; B. D. Sumner, Henry F. Ross, F. C. Hinds, Newton; James F. Shaw, P. W. Sprague, George A. Putnam, Boston.

At the annual meeting, on November 22d, of the West End Street Railway Company, which is under lease to the Boston Elevated Railway Company, the board of directors was re-elected. The annual report stated that there had been a net increase of $760,000 in four per cent. bonds during the year and an increase of the capital stock by the additional issue of 3,000 shares, which netted the company, premiums included, $269,970.

The annual report of the Boston Rapid Transit Commission, which has the supervision of subways and tunnels and the construction thereof in Boston, has just been issued. The document contains a report upon the work accomplished in building the new tunnel from East Boston, under a portion of the harbor, to connect with the Boston central subway system. This report is submitted by Howard A. Carson, the commission's chief engineer. There is also a financial statement of the cost to date of the subway system, including alterations, the total being given as $4,134,758.05. The Boston Elevated paid as rental for the use of the subway for the year ended June 30th the sum of $213,420.44.

The Massachusetts railroad commissioners have authorized the Boston and Worcester Street Railway Company to issue $160,000 20-year 4½ per cent. bonds, for track-building work. They have also authorized the Berkshire Street Railway Company to issue $100,000 20-year 5½ per cent. bonds for extensions. The Worcester and Holden Street Railway Company has asked the commission for authority to issue $25,000 additional stock for extensions.

Following the announcement that the Bristol County Street Railway Company's property is to be sold at public auction comes the statement that similar disposition will be made of the Middleboro, Wareham and Buzzards Bay system. The date of sale is December 17th. Both roads have been in financial difficulty and in the hands of receivers (John T. Burnett and John L. Hall) for several months. It is believed that consolidation of the two lines would enable them to be run profitably, and the sale may result in such a change of management and operation.

In the town of Wilmington about 75 signatures have been obtained to a petition in behalf of a legislative bill for the chartering of an electric power company to utilize the waters of the Deerfield River and its tributaries by erecting a big power plant below Readsboro. Among the promoters of the project are R. C. Corson, George W. Plumb and Faxon Bowen. They ask for the right to erect poles, run wires and supply light and power to the towns of the Deerfield Valley. An authorized capital of $200,000 is contemplated.

Practice crews are operating electric trains in the East Boston tunnel and the finishing touches are in progress on the stations and approaches in preparation for the opening of the route, which is expected to take place early in the coming month.

The New Hampshire Traction Company is to be reorganized, holders of 4½ per cent. first-lien sinking-fund bonds and certificates of indebtedness having chosen Charles F. Ayer and Alfred D. Foster of Boston and Otto T. Bannard of New York as a committee for the formulation of the plan. The company, which was organized about two years ago, controls 135 miles of electric railway in New Hampshire and northeastern Massachusetts, comprising the Amesbury and Hampton; Seabrook and Hampton Beach; Haverhill and Plaistow; Haverhill, Plaistow and Newton; Portsmouth and Exeter; Dover, Somersworth and Rochester; Exeter, Hampton and Amesbury; Hudson, Pelham and Salem; Haverhill and Southern New Hampshire; Lawrence and Methuen, and Lowell and Pelham; also the Rockingham County Light and Power Company and the Granite State Land Company.

The new electric railway from New Haven to Wallingford, Conn., was opened on Wednesday, November 23d. The connecting link from Montowese to Wallingford, just completed, makes a through trip from New York to Boston by trolley possible, via New Haven, Hartford and Springfield. It is owned and operated by the Consolidated Railroad Company.

Work has begun on the construction of the tunnel in the Washington Street section of Boston, and the second contract for one of the sections has been let to Patrick McGovern, who was awarded the first-section contract about a fortnight previous, to be completed in June, 1905. B.

New York.

New York, November 26.—The subway extension from Ninety-sixth Street up Lennox Avenue to One-hundred-and-forty-fifth Street was opened without ceremony at midnight on Tuesday, when an ordinary passenger train with a few officials on board and less than 50 passengers made the first trip. The Lennox Avenue stations present a very unfinished appearance, but this has not deterred a large patronage of the cars. The express-train schedule during the non-rush hours has been augmented so that there is now practically a three-minute service from early morning till midnight between City Hall and Ninety-sixth Street, the trains alternating from that point up the west and east branches. The connection of the subway in the Bronx is timed to be put in operation at midnight tonight in advance of the completion of the tunnel under the Harlem River. Statistics show that during the first four weeks of operation there was a daily average of more than 200,000 passengers. There have been a few mishaps in the working of the system, but no really serious delays.

The East Side Civic Club met on Wednesday to celebrate the opening of the branch of the subway on Lenox Avenue. Club members strongly urged that a new East Side subway be built to free the East Side from its present congested state, and they proposed that a branch should also be built to run to the lower East Side, running across town from west to east.

The question of plans for future subways about New York city depends much upon the question which is now mooted before the Rapid Transit Commission as to sending before the Legislature a bill including a provision for the removal of the clause from the present act exempting subways from taxation. The commission thinks it is strong enough now to demand the removal of such an exemption.

It is alleged that the Commercial Cable Company intends to unite with the American Telephone and Telegraph Company. The Commercial Cable Company controls the Postal Telegraph-cable Company, but is, itself, controlled by the Mackay company. A step which is believed in Wall Street to point toward the rumored consolidation has been the obtaining from the secretary of state at Albany on Wednesday a certificate of "extension of purposes" so as to include the right to purchase, hold and dispose of the bonds and securities of other corporations.

During a fire early last Saturday morning much inconvenience was caused by the cutting of the fire-alarm cables. At the investigation which ensued Fire Commissioner Hayes told the representatives of the New York Edison Company that this practice during fires was quite intolerable, to which the representatives of the Edison company answered by proving that the cable cutting was entirely an accident.

Two new 75-kilowatt direct-current generators driven by two 120-horsepower engines are to be installed at the power house at the Brooklyn end of Brooklyn Bridge.

The Magnetic Control Company of New York city was incorporated last week with $1,000,000 capital to manufacture electrical and magnetic machinery. The directors are: A. Leonard Brougham, George W. Giddings, Albert Graham, Arthur J. Raymond and Jackson Wallace of Brooklyn; Myron D. Law of New York and William Klinger of Hoboken, N. J.

The report of the expert electrician appointed by Secretary Morton on the proposition to consolidate the power plants at the Brooklyn navy yard has been received by the secretary. It was proposed to provide one general power plant in place of the existing separate plants now in use for each bureau. The report has not yet been made public, but it is generally supposed that it favors consolidation in the interest of economy. D. W. W.

Dominion of Canada.

Winnipeg, Man., November 26.—The City Council of Brandon, Man., has given the Western Electric Light and Power Company of Brandon the same privileges as those enjoyed by the Brandon Electric Light Company and the company now goes on with its work.

The Eau Claire Light and Power Company of Calgary, N. W. T., has been given a contract for lighting the streets of Calgary and will immediately proceed to buy and install an arc-light plant for that purpose. Thomas Underwood is mayor.

The Canadian Northern Telegraph Company is

building an additional line from Winnipeg to Brandon, Man. This new line will run along the Carberry extension through Portage la Prairie as far as Carberry and thence along the highway to Brandon, thus giving the company two routes into Brandon.

The Vancouver, Westminster and Yukon Railway Company has taken steps to have a telegraph line established between Vancouver and New Westminster. Mr. E. J. Little, general superintendent of the Great Northern telegraphs, has been looking over the proposed line preparatory to the poling and wiring.

The Bull River Falls Power and Light Company has commenced work on its electric-power plant at Cranbrooke, B. C. A flume two miles in length will be built. H.

Toronto, Ont., November 26.—The Board of Control has decided to buy out the Consumers' Gas Company of this city and run it as a municipal concern and has instructed the city treasurer to purchase $1,000,000 worth of stock as a beginning. R. T. Coady is the city treasurer.

It is proposed to submit a proposition to the taxpayers of Westmount, Que., for authority to buy an electric-light plant to be run as a municipal plant. Part of the power will be obtained from a garbage consumer. The estimated cost of the electric plant and the garbage consumer is $225,000.

Experts engaged to value the plant of the St. Thomas (Ont.) Gas and Electric Light Company have arrived at a satisfactory settlement of the price to be paid by the city of St. Thomas. The sum of $196,366.38 was settled upon as the purchase price of the works. The plant will be overhauled and additions made to it. W. B. Doherty is the city clerk.

Harry Symons of Toronto has made a successful application before the Board of Railway Commissioners at Ottawa on behalf of the Niagara-Welland Power Company for four permissions. Two of them were for crossing privileges over the Grand Trunk railway, another to cross the Toronto, St. Catharines and Niagara electric railway and the fourth was to settle the mode of crossing the Toronto and Niagara Power Company's transmission lines. He also obtained permission to construct a canal under the tracks of the Grand Trunk in the township of Stanford; also for the construction of overhead flumes over the Grand Trunk tracks in the same township.

Plans have been prepared for a new power house for the Southwestern Traction Company at London, Ont., and as soon as the site has been chosen tenders will be called for. The building and equipment will cost about $200,000. A. E. Welch is the manager of the company.

The Algoma Power Company of Berlin, Ont., has been incorporated with a capital stock of $100,000 to construct and operate works for the production and distribution of electricity. The directors are D. B. Detweller and C. K. Hagedorn of Waterloo, Ont., and others. H.

Ohio.

Cleveland, November 26.—Events of the last week tend to straighten out the affairs of the Everett-Moore syndicate. The Citizens' Savings and Trust Company of Cleveland purchased about $600,000 of the Northern Ohio Traction and Light gold bonds at a fair price and $60,000 bonds were sold to another syndicate. The proceeds of the latter will be used to reduce the floating debt to $50,000. The sale of $8,200,000 bonds of the Detroit United was also made to an eastern syndicate. A large portion of the proceeds of this sale will be used to retire bonds of the old Detroit Citizens' Railway Company, which are due in July, 1905. The sale, however, clears up the troubles of the syndicate in that direction. It has been stated that the indebtedness of the syndicate has been reduced from $4,500,000 to $1,500,000 within the last year. A member of the bankers' committee is quoted as saying that within a short time sufficient funds will be realized to clear up the affairs and put the business wholly in the hands of the syndicate.

An ordinance was introduced in the City Council at Cleveland a few days ago for the purpose of granting the Cuyahoga Light and Power Company a franchise to operate in the streets and alleys, subject to existing regulations. This is the new company that was incorporated a week or two ago. City Solicitor Baker says that the council has no power to grant a franchise to the new company, as the statutes provide that where a lighting plant is already in operation in a city, a vote of the people is required for a franchise for a new company.

A resolution has been prepared by the Cleveland Board of Health which has for its purpose the limiting of the number of persons who shall ride upon any one street car. The number shall not exceed as many passengers as can be seated on all the seats and half as many again standing, and the conductor of the car is expected to be responsible for the violation of the rule.

Cars on the Columbus, Urbana and Western will be in operation from Columbus to Fishinger's Mill by December 10th. The portion of the road now in operation is producing a good income.

The Lake Shore Electric has allied itself with the Clover Leaf in making Fair rates to St. Louis. Considerable business has already been originated by the electric road.

Captain J. Benson Foraker is having a private car constructed that will be unique in many respects. As far as possible electrical devices will be used for all purposes. The buffet will have a complete electrical cooking outfit.

G. B. Saltzgaber is promoting an electric line from Van Wert to St. Marys, where it will connect with the Toledo and Ohio Central.

The Springfield, Charleston, Washington and Chillicothe road has been completed to a point near South Charleston, and the first car made a trip over it a few days ago.

It has been decided to use a current of 2,500 volts instead of 1,750 in the electrocution of criminals in the penitentiary hereafter. The last electrocution required three applications of the current. With an increased current there will be little danger of death not taking place on the first application, although it may be necessary, it is said, to make some arrangements to prevent burning the flesh where the sponge electrodes contact.

Cleveland councilmen are still working to arrange some plan for a cross-town line. The people, especially of the eastern portion of the city, are clamoring for accommodations of this kind.

C. W. Comstock, president of the Cincinnati, Georgetown and Portsmouth Railway Company, is building an electric line from Bethel to Felicity, Ohio. The new line will touch the Cincinnati, Georgetown and Portsmouth at Bethel and will form a feeder for it. The extension of the original line to Russellville is almost completed. In a distance of 3½ miles there are trestles 300 feet long and 50 feet high. O. M. C.

Indiana.

Indianapolis, November 26.—The Evansville and Henderson Traction Company has not yet established its right to cross the Ohio River on the Henderson bridge, and for that reason the Board of Public Works has granted the company an extension of time in which to begin the work of building the road.

At a recent meeting of the directors and officials of the Evansville and Eastern Electric Railway Company, reports submitted showed that the work on the line was being rushed according to contract and that the affairs of the company were in first-class condition. W. H. McCurdy, president of the Hercules Buggy Company, was elected to succeed L. E. Fricke on the board of directors, and F. W. Reitz was elected vice-president, to succeed J. W. Fuquay.

S. W. Williams, Dr. C. W. Benham and other promoters of the Western Indiana Traction Company, with principal offices in Vincennes, have recently returned from New York, where they succeeded in financing the proposed road for $1,250,000 with the Trust Company of America. The road will be constructed in the immediate future and will run through several towns in Knox County, and thence to Terre Haute.

The stockholders of the Columbus, Greensburg and Richmond Traction Company held their annual meeting in the company's office in Indianapolis on November 19th, and elected directors, who chose the following-named officers: President, H. F. Holland; vice-president, Walter McConaha; secretary, A. H. Carter; treasurer, William P. Myer.

More than usual interest attaches to the filing of articles of incorporation by several traction companies during the week, because of the large development they promise. The first of these is the Interstate Traction Company, with principal office in Bluffton, Ind. The capital stock is placed at $150,000. The object of the company is stated to be for the construction and operation of a traction line from Marion, Ind., to the city of Lima, Ohio, extending through Grant, Huntington, Wells and Adams Counties in Indiana, and the counties of Vanwert and Allen in Ohio—a distance of 90 miles. The incorporators are C. H. Bundy of Marion, F. M. Caldwell, J. H. Painter, John C. Curtis, E. L. Murry, J. S. Postal, A. G. King and A L. Sharpe of Bluffton.

Another new company is the Indianapolis, Newcastle and Toledo Electric Railway Company, incorporated with a view of building a system of electric traction lines that will touch 27 eastern towns and cities and serve an estimated population of 150,000. The capital of the company is $3,500,000, and large blocks of the stock have been subscribed for by the following promoters of the large enterprise: R. M. Churchman, D. M. Parry and W. E. Stevenson of Indianapolis, E. H. Bundy, C. S. Hernley, F. M. Ingler of Newcastle and Eli Maroni and C. N. Mikels of Frankfort. The new company absorbs the Indianapolis, Newcastle and Winchester company, incorporated a few weeks ago, the proposed line of E. T. Ice from Newcastle to Muncie and the projected line of C. N. Mikels from Newcastle to Richmond. All of the proposed branch lines will parallel steam lines with the exception of the Maxwell branch to Greenfield. Mr. C. S. Hernley, vice-president and general manager, while in Indianapolis to file the papers said: "There is a necessity for a straight short line between Indianapolis and Lake Erie. There is a growing section of the country to be served, besides we expect to do a good freight business by piercing the oil fields and transporting oil to the Belt road in Indianapolis. According to present plans, the power house will be constructed at Newcastle."

As the result of a street-railway war in Michigan City, the Chicago, South Shore and South Bend Electric Traction Company proposes to build a road in 10 days. Nearly a year ago the company obtained a franchise to build its line in Michigan City, with the condition that the line was to be in operation by December 1, 1904. An extension of time was denied by the council, and the company immediately began the preparation to build the link through the city within the prescribed time.

The Indianapolis and Cincinnati Traction Company has received two new cars for freight and baggage—the first of a large installment of new equipment ordered for the line to be opened between Indianapolis and Rushville in a few days. The Shelbyville branch will also be equipped for hauling freight at the same time.

The American Lighting Company of Baltimore, Md., is bidding against the Evansville Gas and Electric Light Company for lighting the streets of Evansville for five years. The bids by the American company will be on several different styles of lamps. Indications point to higher rates than there are in force at present.

Manager Reynolds of the Northwestern Traction Company announces that the company is now ready to furnish farmers along its line with electricity for various uses. He says there is no question that electricity is an economical power for use on the farm for the operation of farm machinery and lighting buildings. "We are now ready to take up the question with prospective customers and make such arrangements and rates as will be entirely satisfactory to them," said he.

The Kokomo Electric Company has been incorporated to carry on a general manufacturing and trading business in electrical supplies and appliances.

The Chrisney Electric Light Company has incorporated with a view to installing an electric-light plant in Chrisney, Spencer County. S. S.

Northwestern States.

Minneapolis, November 26.—John Harry is making preparations to put in an electric-light plant at Alma, Wis.

H. R. Healy has sold the electric-light system at Waverly, Iowa, to the city, the consideration being $13,500.

An ordinance has been framed at Iowa City, Iowa, granting a franchise to the Iowa City-Davenport Interurban Railway Company.

Dr. W. F. Pierce and others of Carson, Iowa, propose building a trolley line from Carson to Council Bluffs.

An electric railway from Vinton, Iowa, to Belle Plaine is projected.

Plans have been perfected to build an electric railway from Kenosha, Wis., to Lake Geneva.

The Omaha (Neb.), Lincoln and Beatrice Interurban Railway Company is planning to handle freight, in addition to its passenger traffic, as soon as its new line is completed.

An electric-light plant will be put in at Melrose, Minn.

The Jordan (Minn.) Electric Light and Heating Company will install a large storage battery in order to give a 24-hour service. F. J. Leonard has been elected president and J. E. Casey secretary of the company. R.

Michigan.

Detroit, November 26.—The Standard Electric Company has begun suit against the Scenic Railway Company to foreclose, under an alleged mechanics' lien, on the buildings, machinery, etc.

The Adrian and Ann Arbor Electric Railroad Company has asked the Ann Arbor council for a franchise and agrees to have the line in operation 18 months after a franchise is granted.

It is understood that the General Electric Company is figuring on estimates to convert the branch of the Michigan Central railroad running south through Sturgis to Goshen, Ind., into an electric line. Estimates and designs are being gotten out for the electric locomotives to operate the line. It is understood that the Westinghouse Electric and Manufacturing Company of Pittsburg is also furnishing estimates and plans. The road passes through fine farming country, and if converted into an interurban line will handle passengers and freight. This will be the first steam road in Michigan to be converted into an electric railway.

A director of the Detroit, Monroe and Toledo Short Line recently stated that a contract had been made with the Holland Palace Sleeping Car Company of Indianapolis to furnish the sleepers to be run out of Detroit to Cleveland, and it is understood that this arrangement will go into effect in the near future.

It is now quite certain that the Detroit-Bay City electric line will be constructed. The right-of-way is practically all secured. There is, however, considerable doubt in Pontiac as to the road coming through that city. On November 3d the council granted the company a franchise allowing 20 days for its acceptance.

The Coldwater Common Council has granted a franchise to the Toledo and Michigan electric railroad, to be built to Coldwater from Adrian, next

season. The roadbed is already graded to a large extent. The franchise for the Battle Creek and Coldwater electric railway was up for final passage, but Promoter Griffin declined to accept the terms and requested its withdrawal.

Beginning Monday, the Detroit, Ypsilanti, Ann Arbor and Jackson electric railway will inaugurate its new limited service. The company is now arranging the runs, which will include several innovations. It is expected to do away with the special students' tickets, which have been sold to students attending the university and other schools at the rate of $7 per 1,000 miles. It is said that nearly 100 students travel between Ann Arbor and Ypsilanti every day.

The Wayne Automobile Company of Detroit has filed articles of association, incorporating for $300,000. Of this capital, $8,200 has been paid in cash and $24,000 in other property, including the assets of the Wayne Automobile Company, at present located in Detroit. The stockholders are Charles L. Palms, William Kelly, Roger J. Sullivan, J. B. Book and E. A. Skae. C. G. W.

Rocky Mountain States.

Salt Lake City, Utah, November 24.—The Washoe Power and Development Company has nearly completed its canal and electrical power plant which will supply electrical energy for the cities of Sparks and Reno, Nev. As the buildings are now almost ready for the installation of machinery and the canal, which has been in course of construction for two years, will be finished within a month or two, it is stated by the management that the new plant will be thoroughly equipped and in operation by the first of March of next year. The plant will have an initial capacity of 1,000 horsepower, this to be increased later to 3,000. The company was incorporated in 1892 with J. E. Humphrey as president, John Evans, vice-president, and F. H. Norcross, secretary. The authorized capitalization of the company is $300,000.

I. B. Perrine, whose headquarters are at Boise, Idaho, has filed upon the waters of Trout Creek, near the Blue Lakes, where a fall of 50 feet will generate 1,200 horsepower, and at which point he proposes to construct an electric plant.

The Idaho Power and Transportation Company is preparing to commence work on the construction of a dam at Idaho Falls, Idaho, with a view to the installation of a power plant at that point.

Preliminary steps for organizing a company to construct a series of electric railways branching from Kalispell, Mont., to all parts of the valley, have been taken by the Chamber of Commerce of Kalispell. F. W. Tinkel heads a committee on organization.

The Havre Electric Company has been incorporated at Havre, Mont., with a capital stock of $100,000. The incorporators are H. W. Turner, M. Hebgen, J. H. Smart and others of Butte, Mont.

Frank Brown, manager of the Jumbo mine at Lewiston, Idaho, has purchased a complete electric power plant to be installed at the mine by January 1st. This plant will furnish sufficient power for all the mining machinery on the property. G.

Pacific Slope.

San Francisco, November 25.—Daily communication is now maintained between the space-telegraph stations at Mare Island and Goat Island, but the signal service from the Farallons has been discontinued. The Navy Department, however, is to reestablish the system soon, and George E. Hanscom will be sent out to install the apparatus.

The San Francisco Gas and Electric Company is striving, by means of injunction suits, to prevent its only dangerous rival, the Mutual Electric Light Company, from laying wires in the various important thoroughfares in San Francisco. Two injunctions have been obtained. The Mutual Electric Light Company is constructing a power house at Spear and Folsom Streets, and is laying a duct 12 inches square containing 11 electric wires, down Market Street. The work includes two underground stations in each block, about six feet deep, seven feet long and five feet wide, made of brick and topped with an iron cover. The ducts are made of wood, covered with tar or creosote. The San Francisco Gas and Electric Company claims that, being laid in close proximity to its gas mains, electrolysis will take place and great damage will result.

The Peerless Electrical Works, 284 Stevenson Street, San Francisco, is doing the electric wiring in the new building being erected on Commercial Street, opposite the United States Treasury Building.

A huge 15-foot bowlder rolled upon the flume of the American River Electric Power Company's power house near Stockton recently, and the service was cut off for some time.

The Martland Electrical Company is doing the electrical work in a building in course of construction at 235 Third Street, San Francisco.

The trustees of Santa Ana, Cal., have adopted an ordinance granting to the Los Angeles-Interurban Railway Company the right to construct and maintain an electric railway in the city of Santa Ana.

Work is to begin within a year on the proposed electric railway between Santa Maria and Guadalupe, Cal., the franchise for which has been granted.

D. L. Huntington, general manager of the Washington Power Company, states that it will be but a short time before conditions at Post Falls, Wash., will be such that the company will have a power plant there with a capacity of 18,000 horsepower. It is understood that the company will in the near future begin extensive improvements on the plant at Spokane, Wash., with a view of increasing the capacity in that city.

The Spokane Southern Traction Company, promoted by Mark F. Mendenhall of Spokane, Wash., has increased its capital stock from $500,000 to $2,000,000, and has enlarged its plans from the building of an electric road across Moram Prairie to building across the Palouse country to Colfax. A traffic contract has been closed with the Washington Power Company to enter the city over the power company's lines. Plans are completed and finances are assured for the construction of a main trunk line and several branches, aggregating over 100 miles in length.

The Cuyamaca Mining Company, which is developing the Stonewall mine in the Cuyamaca Mountains near San Diego, Cal., will erect an electric plant in the near future.

The Thomas Day Company is furnishing the elaborate electric fixtures for the Security Savings Bank Building on Montgomery Street, near California Street, San Francisco, at a cost of $2,000.

An ordinance has been presented to the City Council of Seattle, Wash., providing for the submission to the people of a proposition to issue bonds in the sum of $250,000 for the distribution of lights to the residence districts. An ordinance has also been presented instructing the Board of Public Works to purchase from the Seattle Electric Company its street-lighting circuits and appurtenances connected therewith.

The Pacific Electric Railway Company has a large force of men at work double-tracking its line between Hermosa and Redondo, Cal.

The Weidenthal-Gosliner Electric Works will install the electric wiring and apparatus for Mary T. Rae in an eight-story building on Powell Street, near O'Farrell, San Francisco. The work will cost $1,091.

The Loon Lake Water and Power Company has been incorporated at San Francisco by S. Forbes, C. Forbes, W. Gregory and others. The capital stock is $200,000.

Attorney L. F. Puter, representing the North Mountain Power Company, has presented a petition to the supervisors of Humboldt County, Cal., for a power franchise. The date of its sale has been fixed for December 15th.

The Joshua Hendy Machine Works has secured the contract for the wiring of the large building being erected in San Francisco on Sacramento Street, near Drumm. A.

PERSONAL.

Nelson Stow, said to be the first builder and operator of an electric street-car system in Binghamton, N. Y., died at his home in Binghamton, on November 20th.

Frank H. Bristol, vice-president of the Bristol Company of Waterbury, Conn., manufacturer of recording instruments, was instantly killed on November 21st by a fast passenger train which struck his closed automobile in which he was crossing the tracks of the New Haven Railroad in Waterbury. Mr. Bristol was prominent in Waterbury and throughout the state.

William J. Hammer of New York, well known as a consulting electrical engineer and an enthusiastic electrical collector, was in Chicago last week, on his way to St. Louis, where he has, or did have, a remarkable historical exhibit of incandescent lamps, which was one of the features of the display in the Palace of Electricity. Mr. Hammer was also one of the electrical jurors of award.

Thomas D. Lockwood, Dr. Louis Duncan, Dr. F. A. C. Perrine, Charles F. Scott and W. S. Barstow, all prominent in the electrical industry, have become members of the faculty of the Polytechnic Institute of Brooklyn in a consultatory capacity. In the order named, each will be identified with a special branch, as follows: Telephony, telegraphy and patent practice; electric traction; electric power transmission; commercial engineering; central-station engineering.

Frank E. Scovill, superintendent of the Austin Electric Railway Company of Austin, Texas, was tendered an oyster roast by the employes of the company on the occasion of his recent departure for Laredo, Texas, where he assumes the management of the street-car company of that city. The employes presented Mr. Scovill a handsome gold watch and chain. Several hundred of Mr. Scovill's personal friends in Austin also made the occasion of his departure a memorable one to him by a gathering at the Austin Club, where he was presented a large diamond stud.

The following-named persons were registered at the booth of the Western Electrician at the World's Fair, St. Louis, last week: H. G. Belcher; William N. McIntyre, Sparta, Ill.; William McFadden, National Soldiers' Home, Wisconsin; J. W. Johnson, Almont, Iowa; W. C. Hoover, Springfield Traction Company, Springfield, Mo.; E. N. Hardy, Union Light and Power Company, St. Louis, Mo.; W. H. Venghn, I. C. R. R., Evansville, Ind.; F. W. Mullen, St Louis, Mo.; Mr. and Mrs. A. C. Berny, Worcester, Mass.; Harry Little, East St. Louis, Ill.; Sig. Losos, East St. Louis, Ill.; Herbert Baker, Chatfield, Ohio.

A dispatch from Boston says that two 15-year-old boys of that city have established wireless telegraphic connection between their homes, half a mile apart. This recalls the fact that 30 days after the appearance of the first published accounts of Bell's invention of the telephone two New York boys had built and were successfully operating an experimental telephone system of their own. These two boys have since achieved distinction in the electrical field, and have for many years been allied in business. They are Prof. Francis B. Crocker of Columbia University and Dr. S. S. Wheeler.

Frank J. Colbert died at his home in Detroit on November 12th in his 31st year. Some months ago he went to Milwaukee to act as private secretary to Mr. G. F. Randall, president of the National Electric Company. While acting in that capacity he was taken ill and was brought home for treatment. His progress for a time was favorable, but an operation was ultimately deemed advisable, from the effects of which he never recovered. Several years ago Mr. Colbert was business representative in Chicago of the Electrical Review of New York. He was a bright, engaging young man, gentle in manner, with a keen appreciation of the humorous in life. He was universally liked, and the news of his death will be distressing to all who knew him.

The report in Chicago on Monday morning that Miss Maud and Master Stanley Arnold, children of Bion J. Arnold, who are with their mother at Colorado Springs, Colo., had lost their way on a lonely part of Pike's Peak, caused considerable anxiety to Mr. Arnold and his friends. The children, 17 and 15 years old, respectively, had climbed Pike's Peak on Saturday in company with a companion. On the return trip darkness overtook them and they were compelled to spend the night without shelter in the mountains, having lost the trail in the darkness. Searching parties were sent out, but the anxiety of Mrs. Arnold and friends was relieved at noon on Sunday, when the young people returned to Colorado Springs, having found the trail themselves. A telegram from Mrs. Arnold stated that the children had been safely returned.

Dr. Louis Duncan, who is known throughout the technical world for his attainments in electrical work, has become associated with the staff of the Allis-Chalmers Company of Milwaukee. Dr. Duncan has been retained by the Allis-Chalmers Company as an expert in electrical patent work in connection with its electrical department, the Bullock Electric Manufacturing Company of Cincinnati. This connection has only recently been made possible by the retirement of Dr. Duncan from the chair of electrical engineering at the Massachusetts Institute of Technology, to which he was appointed in 1892. Finding that it would be impossible to do justice to the Institute, unless he gave up his constantly growing business as a consulting engineer and expert, Dr. Duncan decided to resign his chair. He will continue to make his headquarters in New York.

ELECTRIC LIGHTING.

The Ramona Light, Heat and Power Company of Ramona, I. T., has been incorporated.

A new electric-light plant has just been finished at Lynch, Neb., the first light being furnished last week.

The Board of Public Works of Oneida, N. Y., is receiving bids for lighting the streets and public places.

The Norton Light and Cold Storage Company has been incorporated at Norton, Kan., with a capital stock of $35,000.

The new electric-lighting system of Sandersville, Ga., has just been completed and a satisfactory test of the lights was made.

The Nebraska Lighting Company has been incorporated with a capital stock of $100,000. The company will be located in Plattsmouth, Neb.

The machinery for the new power house at Newberry, S. C., has been received and the old arc lamps will soon be replaced with improved street lamps.

The City Council of Hobart, Okla., recently bought the electric-light plant for $74,000, but, it is said, after an indignation meeting in the town the action was rescinded.

The El Paso Gas and Electric Company of El Paso, Texas, has been incorporated with capital of $500,000 by Barret Ridgely of Washington, D. C., George Goodnow of Waukegan, Ill., and others.

Articles of consolidation and merger of the Negaunee and Ishpeming (Mich.) Street Railway and Electric Company with the Negaunee Gas Light Company have been recorded. The new corporation will be known as the Marquette County Gas, Light and Traction Company and will be capitalized at

$400,000. The directors are Thomas A. Rockwell and Thomas B. Clerk of Evanston, Ill.; George A. Rockwell of Oshkosh, Wis.; John H. Bryant, Jr., of Chicago, and E. B. Finch of Ishpeming, Mich.

The Patterson Street Lighting Company of St. Paul, Minn., with $50,000 capital has been incorporated by Charles Patterson, Thomas McDermott and others.

S. C. Dorrell of Walnut Ridge, Ark., and associates contemplate building a $25,000 electric-light plant in Pocahontas, Ark., where they have applied for a franchise.

A new electric-light plant is to be established in Atlanta, Ga., by the Peachtree Lighting Company, just organized, by Arnold Broyhs, Martin Amorous and Edward Brown.

The municipality of Barcellos, Portugal, offers a 30-year concession for the erection of an electric-light and power plant. The company must furnish the town with 160 16-candlepower incandescent lights and six 50-candlepower arc lights for $1,620 a year.

The Denver Gas and Electric Company, Denver, Colo., continues to send out cards, booklets and folders, adorned with attractive pictures and catchy sentences intended to set prospective customers thinking about the company's products and the advantages in using them.

The municipal-light plant located in East Joplin, Mo., was destroyed by fire a few days ago. The East Joplin fire department apparatus in the same building was also destroyed. The department at that time was answering a call in another part of town. The loss is probably $75,000.

The Yankton Improvement Company of Yankton, S. D., has been organized with a capital stock of $100,000, with Isaac Piles, William S. Stockwell, Sanford G. Donaldson as incorporators. The plan is to ask the City Council for a franchise to build and operate an electric-light and gas plant.

ELECTRIC RAILWAYS.

A new electric-railway company is applying for a franchise in San Jose, Cal., from the western part of the city to Santa Teresa.

The electric railway of the Indian Territory Traction Company from South McAlester to Hartshorne is expected to be completed by January 1st.

Traffic on the Aurora, Elgin and Chicago third-rail line during October was exceptionally good and the report shows good gains in earnings. The gross receipts from the month were $42,712. The net earnings were $21,511 and $18,799, respectively, for October, 1904 and 1903.

Horace E. Andrews and J. J. Stanley of Cleveland have inspected the Fonda, Johnstown and Gloversville road, which parallels a portion of the New York Central in New York, and it is reported that negotiations are now under way for its purchase by the Vanderbilt interests.

Colonel W. H. Chase of Toledo, Ohio, is promoting an electric railway between Kansas City and St. Louis, a distance of 225 miles. Congressman J. H. Southard of Toledo is interested in the plan and it is stated that it has been financed. The route is 22 miles shorter than the shortest line now in operation between the two cities. The plans include high-grade construction.

The Circuit Court in Cleveland, Ohio, has declared invalid the Denison Avenue franchise of the Forest City Railway Company, better known as the "three-cent-fare street-car line," on the ground that the company did not have the necessary frontage consent. An injunction against the company was allowed. Mayor Tom L. Johnson is credited with being interested in the company.

Suit has been brought to prevent the St. Louis Transit Company surrendering its lease to the United Railways Company of St. Louis and to require Brown Bros. & Co. of New York, who negotiated the deal, to return all stocks, bonds and other securities received from the Transit company since September 1, 1904. The defendants named in the suits are the United Railways and Transit companies.

The Chicago City Council at its last meeting rejected an order for the appointing of a committee to investigate the genuineness of the petition for a referendum of all franchises for street-car companies at the spring election. The petition contains 133,903 signatures and it was estimated that to do the work of investigating in a thorough manner would cost the city $25,000. The council, by refusing to investigate the petition, takes it for granted that the document is all right.

George C. Webb has been appointed receiver for the Blue Grass Consolidated Traction Company of Lexington, Ky., which was incorporated with a capital stock of $7,000,000 to build a system of interurban roads about Lexington and the central part of the state. The property of the company, which consists largely of valuable franchises, will be sold at public auction. It is believed the company will realize enough to pay all debts. Senator George B. Davis of Detroit controls the company. It is understood that the Cincinnati Trust Company will underwrite $7,000,000 bonds of the Blue Grass Traction Company and it will thus be able to go ahead with its plans of extending operations and building new roads. A line from Lexington to Versailles is a possibility within the next 12 months.

A resolution was placed before the City Council of Evanston, Ill., recently to allow the Chicago, Milwaukee and St. Paul railroad to change its motive power from steam to electricity. This is believed to be a forerunner of the proposed plan to make connections with the Northwestern Elevated railroad, and it is said that if the resolution is approved the railroad company may sublet the privilege to the Chicago and Milwaukee Electric Railroad Company, which now operates cars between Waukegan and Evanston. The measure was referred to the transportation committee.

The Chicago and Southern Traction Company has just been incorporated by Chicago men, who propose to begin work on the building of an electric railway from Chicago to Kankakee, with stations at Harvey, Homewood, Matteson, Monee, Peotone, Manteno, Tucker and Bradley. The stockholders have elected William S. Reed president, Attorney Charles F. Davies vice-president, John B. Reed secretary, and Robert Woods of Indianapolis treasurer. Mr. Davies said that more than two-thirds of the right-of-way had been secured and that the capitalization of $100,000 would be increased to $5,000,000 and work started as soon as possible.

Alderman Foreman, chairman of the Chicago local transportation committee, has received a letter from Haakon Erikson, manager of the Christiania (Norway) municipal street railways, in which he asks advice on how to treat the traction problem in the capital of Norway. He states that the Christiania City Council soon must settle the question of taking over the property of a great private tramway company, the franchise of which expires in 1905, the city having power to acquire the tangible holdings at their real value. The company has asked a new franchise. He wants a short account of the state of Chicago's traction question and "its further supposable results." Alderman Foreman does not know what his reply will be, but says it will be "interesting."

SOCIETIES AND SCHOOLS.

At the next meeting of the Electrical Section of the Western Society of Engineers, which will be held in Chicago on December 16th, Prof. Henry Crew of Northwestern University will lecture upon "Modern Theories of Electric Arc and Spark."

Secretary Dudley Farrand of the National Electric Light Association has notified the members with regard to the annual meeting of the Underwriters' National Electric Association, to be held in New York city on December 7th. A number of interesting changes and revisions of rules as to wiring, fixtures and other matters relative to electric-light and power supply, that deeply affect the welfare of the central-station industry, are to be considered. The National Electric Light Association, which has always followed insurance questions closely, is taking an active and vigilant interest in all that tends to perfection of methods and increase of safety.

PUBLICATIONS.

A circular from the G. and C. Merriam Company of Springfield, Mass., publisher of Webster's International Dictionary, calls attention to the new edition of that work which has recently been issued containing 2,380 pages, 5,000 illustrations and 25,000 new words, bringing it abreast of the growth of the language.

"Automatic-start Induction Motors" is the title of bulletin No. 3062, coming from the Emerson Electric Manufacturing Company of St. Louis. The bulletin describes clearly the advantages of the motors, which are a new type. A diagram of field connections is also given which aids in obtaining a clear understanding of the apparatus. Dimension drawings and data upon the different types are contained in the bulletin for convenience in ordering.

William Roche of New York city, who is the manufacturer of a large number of specialties in the electric line, such as dry batteries, gas-engine igniters, spark plugs, spark coils, flashlight cigar lighters, etc., has issued a small catalogue describing these articles collectively. There is besides the mere description of apparatus considerable helpful information given in the booklet, such things being treated as the insulation of the secondary circuit of induction coils, regulation of the rheotome, make-and-break mechanism, etc., all of which apparatus has its periods of being vexatious to the operator.

"The time has come when every business man in Brooklyn and every householder whose income is sufficient to meet the ordinary requirements of a comfortable existence can afford and can enjoy the notable comforts and conveniences of an electric service" is the announcement which comes from the Edison Electric Illuminating Company of Brooklyn in the form of a circular. This bold assertion is not all that is contained in the little circular, however, but it contains also that which goes to prove the statement—facts and figures. The circular is a neat form of advertising literature.

MISCELLANEOUS.

A large party of northern and southern capitalists recently visited the Narrows on the Yadkin River near Salisbury, N. C., where the Whitney Reduction Company will soon begin active operations.

Sir Ernest Cassel, the well-known Anglo-German financier who made all the monetary arrangements for the great Nile (Egypt) dam works and who is a close friend and trusted adviser of King Edward, is in this country in connection with the establishment on the banks of the Nile of a system of trolley motors for the towing of barges and dahabiyeh. This will relieve the traffic of the railroad to upper Egypt and will, it is said, enable the conveyance of passengers and freight in one-tenth of the time hitherto required to dispatch them by water, steamboat traffic being very much restricted.

A deadlock has arisen between Mayor Fagan of Jersey City and President Thomas N. McCarter of the Public Service Corporation, which organization controls all the electric power, motor and lighting companies in North New Jersey. The mayor wished to inaugurate extensive improvements in the main streets, and having got the public sanction requested the company to co-operate. The president answered by protesting against the mayor's treatment of the company he represented, and he refused to take any steps in this direction until certain vexatious requirements against the company are withdrawn.

The executive committee of the Philadelphia Fire Underwriters' Association in a bulletin to members calls the attention of the public to the dangers to life and property from Christmas displays, decorations, signs, etc., in churches, public buildings, mercantile establishments and especially department stores. The use of Christmas greens, harvest specimens and other inflammable materials, such as draperies, scenery, cotton to represent snow and the like (especially in connection with electric and other lighting systems) is decidedly an increase of hazard, it being impossible to make displays of that nature perfectly safe.

TRADE NEWS.

The Phœnix Iron Works Company of Meadville, Pa., states that the International Philippine Jury of the Exposition at St. Louis, in its capacity of associate of the board of the Exposition, under the presidency of Secretary of War Taft, has awarded the company a gold medal for the compound engine exhibited in the power plant of the Philippine Government Board.

O. G. Remington, representative of the firm of Wm. McLean & Co., Melbourne, Australia, has been in this country some few weeks in behalf of his firm and is about leaving for a week in England and on the Continent. Mr. Remington intends to be in New York again about December 21st for a few days, en route back to Australia, where he will be open to negotiations from any manufacturer desiring an Australian connection who has lines to offer of merit. His New York address is care of Astor House. His company already handles exclusively in Australia the products of a number of large American electrical concerns.

Suits have been brought against the Jaeger Miniature Lamp Manufacturing Company of New York city and the American Endoscopic Company of Providence, R. I., for infringement of an incandescent lamp on a patent granted to Thomas A. Edison, No. 444,530, in which suits the Edison Electric Light Company is complainant. Two suits in which the General Electric Company is complainant have also been started against the Germania Electric Lamp Company for infringement of patents to Spiller & Massey, No. 537,493, and Mark H. Branin, No. 532,760. The bills of complaint in these four suits were filed on November 22d.

The Bureau of Supplies and Accounts, Navy Department, is inviting sealed proposals until December 13th for furnishing the navy yards at Boston, Mass., Newport, R. I., and Portsmouth, N. H., with a quantity of motors, starting panel, rheostats, generating sets, signal boxes, controlling apparatus for Westinghouse rotary converters, desk fans, ventilating sets, Weston ground detector, signal cable, magnet wire, arc lamps and miscellaneous electrical material. A list of articles required, together with blank forms of proposal, will be furnished bidders upon application to the navy pay offices in the cities mentioned or to the bureau at Washington.

The Providence Engineering Works of Providence, R. I., one of the oldest exclusive builders of large power steam engines, has decided to go into the electrical field and to supply electric motors of smaller power than the steam machines, which it has a reputation for building. After exhaustive investigations and tests extending over many weeks the Providence concern adopted the Storey motor as the machine with which to make its entrance into the electrical field. Mr. Storey, it is said, has been endeavoring to organize a company to manufacture and sell his variable-speed motor and other electrical devices, but instead has closed a contract

with the Providence company for the extensive manufacture and marketing of his motors under the Storey name and supervision.

The plant of the United States Carbon Company of Cleveland, Ohio, is for sale. It is well located as regards railroad and shipping facilities and has its own power plant, lighting and heating system with all modern conveniences. Full information may be had by addressing the Guardian Savings and Trust Company of Cleveland.

The Lee Paper Company of Vicksburg, Mich., has just ordered a 200-kilowatt generator from the Northern Electrical Manufacturing Company of Madison, Wis., for the equipment of its new mill. This is the most recent in a long series of sales of Northern apparatus in paper-mill work, the most prominent installation being the plant of the Consolidated Water Power and Paper Company of Grand Rapids, Wis., resently described in the Western Electrician.

BUSINESS.

E. R. Crolius & Son of Chicago, manufacturers of the Star soldering stick, call attention to the fact that this stick has been on the market for over 10 years and on account of its convenience and effectiveness has given universal satisfaction. Another product of this company well received by the trade is the Crolius commutator compound, which also is in wide use. To anyone not yet familiar with the soldering stick or the commutator compound a free sample will be sent by the manufacturers on request.

The American Electric Fuse Company of Chicago, New York and Atlanta, manufacturer of the Allen-Bradley electric-crane controller, announces that it is now prepared to accept orders for all sizes of electric controllers. The company has been busy in the last six months preparing for the market a number of new designs of controllers. Three months' free trial are given with the privilege of returning the goods if not satisfactory and also one year's guarantee against any repairs. The company before January 1st will have a complete line of rheostats of all types which it will sell under the same guaranty as the crane controllers.

The Electric Storage Battery Company of Philadelphia has recently closed the following contracts for Chloride accumulator installations: Two three-wire batteries for the Union Electric Light and Power Company of St. Louis; one three-wire battery and one exciter battery for the Edison Electric Illuminating Company of Boston; one three-wire battery for the Rochester Railway and Light Company and an increase in the capacity of the first battery installed; an exciter battery for the Interborough Rapid Transit Company, New York; a railroad regulating battery for the Public Works Company, Bangor, Me.; a lighting and power battery for the New York Hall of Records, and a large number of residential and isolated lighting batteries.

The Abner Doble Company, San Francisco, Cal., engineers, has been awarded the grand prize for its exhibit of a 170-horsepower tangential water wheel. The wheel develops 170 horspower at a speed of 700 revolutions per minute with a water pressure of 300 pounds per square inch, equivalent to a hydraulic head of nearly 700 feet.

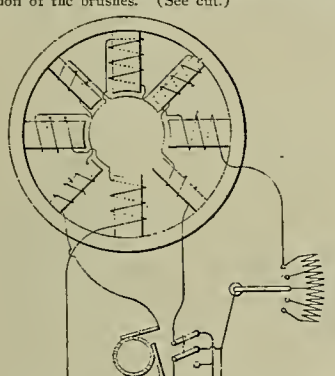
The Central Electric Company of Chicago is sending out circulars to the trade calling attention to the fact that it is prepared to supply from Chicago stock, Christmas-tree lighting outfits and states that the figures it is able to quote are unusually attractive. The outfit contains 27 lamps, two-candle-power, of assorted colors, red, green, blue, frosted, canary and amber. There are 24 sockets and 27 lamps, the three extra being included in case of breakage. The sockets are waterproof and, being enclosed, eliminate the possibility of an electric shock; 50 feet of lamp cord, attachment plug for Edison or T.-H. base, as specified are supplied. Each socket has three strands of eight lamps each, which properly distributes the lamps. The entire outfit will cover a space 15 by 18 feet, enough illumination to light a room 30 by 30, with a 12-foot ceiling.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued (United States Patent Office) November 22, 1904.

775,310. Variable-speed Motor. Mathias Pfatischer, Philadelphia, Pa. Application filed April 7, 1904.

Connections include the coils of alternate poles in shunt relation to the armature, and other connections include other alternate coils in series relation with the armature. Means are arranged to adjustably vary the strength of the field in the shunt coils independently of the series coils whereby the armature is enabled to rotate at variable speed and variable load in either direction without sparking and without variation in the position of the brushes. (See cut.)



NO. 775,310.—VARIABLE-SPEED MOTOR.

775,311. Motor Case and Gear. Leroy S. Pfouts, Canton, Ohio. Application filed August 15, 1904.

Mechanical features of a motor gearing and casing are the basis of the patent.

775,317. Electric Controller. Harry C. Smith and George E. Lippert, Chagrin Falls, Ohio. Application filed April 2, 1904.

In an electric controller are combined a cylinder, a piston contained in the cylinder and arranged to be moved in one direction by fluid pressure, other means for moving the piston in the opposite direction, a contact piece, a swinging arm connected and movable with the piston, a swinging contact piece on the swinging arm and arranged to be moved into and out of engagement with the first-mentioned contact piece.

775,322. Insulated Rail-joint. George A. Weber, New York, N. Y., assignor to the Weber Railway-joint Manufacturing Company, New York, N. Y. Application filed January 27, 1904.

An insulated rail joint, having insulation beneath the base of at least one rail, has a holding device in the form of a piece of tape of suitable material interlaced with the insulation and suitably held in position in the joint for maintaining the insulation in position.

775,334. Alternating-current Electric Motor. Benjamin G. Lamme, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company. Application filed February 27, 1904.

An electric motor having field-magnet pole pieces provided with slots parallel to the armature axis contains also neutralizing conductors that extend through the slots and around the spaces between the pole pieces and magnetizing coils that surround the pole pieces and the adjacent portions of the neutralizing conductors.

775,337. Wireless Telephone. Roberto L. de Moura, New York, N. Y. Application filed October 4, 1901.

In a system of wireless telephony is a call device comprising a microphone, a tube carrying the microphone at one end, a receiver at the other end, an enlargement in the tube intermediate of its ends, and openings in the enlargement to permit communication between the outer air and the contained air column. (See cut.)

775,358. Street-car Fender. Joseph M. Wilderman, St Louis, Mo., assignor of one-half to Louis J. Ringe, St. Charles, Mo. Application filed March 12, 1903.

The car fender is arranged to be held in a partly raised position by an energized electromagnet. Upon the de-energization of the magnet the fender is let drop to its lowest position.

775,380. Cash Register with Distant Indication. William H. Muzzy, Dayton, Ohio, assignor to the National Cash Register Company, Jersey City, N. J. Application filed January 28, 1904.

Incandescent lamp signals to correspond to the various keys on the cash register are thrown into and out of circuit by the keys and indicate the respective keys and cash drawers.

775,390. Electrical Signaling Apparatus. Sewall Cabot, Brookline, Mass. Application filed March 23, 1904.

Combined with a control line is an operating electromagnet, a preparatory electromagnet, armatures for the magnets, closure contacts and electric connections between the control line and the coils of the electromagnets and between the respective coils of the electromagnets, of which the closure contacts are reciprocally controlled by the armatures.

775,408. Electrical Register and System Therefor. Louis A. Schmidt, Chicago, Ill. Application filed February 5, 1904.

A registering device for telephones comprises two counter members and co-operating transmitter devices connected in circuit with the respective main lines, means for effecting a relative movement of the counters and corresponding transmitter devices to take a tactual reading of the positions of the counters and transmit such reading over the main lines, and independently operable responsive devices connected in circuit with the main lines at a receiving station remote from the meter station.

775,416. Electric System of Transmission. Charles G. Burke and Edward J. Burke, Brooklyn, N. Y., assignors of twenty-one thirtieths to John Q. A. Whittemore, Boston, Mass. Application filed December 17, 1903.

An automatic transmitter has means associated with it for sending signals of different intensities. The apparatus includes sending and receiving aerials, a recorder, and means responsive to the different intensities for causing the recorder to record the different indications sent.

775,442. Electric Arc Lamp. Tito L. Carbone, Berlin, Germany. Application filed April 19, 1904.

An arc lamp comprises a frame with a base and top piece and inclined bars connecting the base and top. Holders slide on the inclined bars and carry converging carbons.

775,445. Controlling Switch for Electric Circuits. Maxwell W. Day, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed May 9, 1904.

In a controlling switch for electric circuits are a rotatable shaft, a controller drum carried by the shaft, stationary contacts adapted to be engaged by the drum, two stationary commutators concentric with the shaft, resistances connected to the commutators, and a bridging member carried by the shaft and engaging the commutators, the points of engagement of the member with the two commutators being relatively displaced with reference to the segments of the commutators.

775,453. Regulating Dynamo-electric Machines. Wilbur L. Merrill, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed June 11, 1902.

An alternating-current dynamo contains a vibrator for controlling the voltage and means for supplying the vibrator with direct current of a voltage varying in response to variation of voltage of the dynamo.

775,458. Dynamo-electric Machinery. Henry G. Reist, Schenectady, N. Y., assignor to the General Electric Company. Application filed May 9, 1902.

The field magnetic circuit is provided at one or more portions with two paths for the magnetic flux, one of the paths including a slot in the material forming the magnetic circuit and the other a reduced cross section of the magnetic material of a length greater than the width of the slot.

775,461. Electric Circuits and Apparatus for Railway Signaling. Henry W. Spang, New York, N. Y., assignor to James R. Fancher, New York, N. Y. Application filed January 19, 1903.

Two lines of rails of an insulated section of railway track and a generator connected with farther end of the section are the fundamental parts of the system. Two relays, normally out of circuit, are located at points distant from each other, independent short signal circuits for distant and home signals, located ahead of the near end of the section and respectively controlled by relays.

775,472. Method of Converting the Energy of Fuel into Electrical Energy. Hugo Jone, Chicago, Ill. Application filed November 18, 1901.

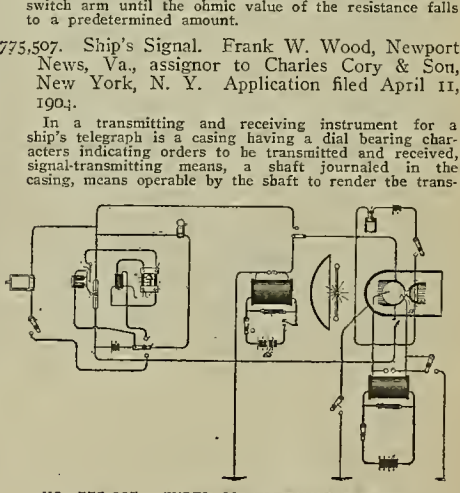
The method of generating electrical energy consists in first combining a metal as the positive plate, with carbon as the negative plate, and an alkali as the electrolyte, in a galvanic cell, at an elevated temperature, generating electrical energy by oxidation of the metal, and then reducing that battery product which contains the metal oxidized in the battery reaction to the metal by means of the oxidation energy of fuel, and repeating the oxidation of the metal with generation of electrical energy.

775,501. Controller. Ernest Schattner, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed May 13, 1904.

A motor-starting rheostat, having a self-reducing resistance, has means for closing the circuit therethrough, a contact, a switch arm arranged to fall by gravity into engaging relation to the contact to short-circuit the resistance, and means for arresting the movement of the switch arm until the ohmic value of the resistance falls to a predetermined amount.

775,507. Ship's Signal. Frank W. Wood, Newport News, Va., assignor to Charles Cory & Son, New York, N. Y. Application filed April 11, 1904.

In a transmitting and receiving instrument for a ship's telegraph is a casing having a dial bearing characters indicating orders to be transmitted and received, signal-transmitting means, a shaft journaled in the casing, means operable by the shaft to render the transmitting means effective, a handle to rotate the shaft provided with means associated with the dial to assist in the control of the transmitting means, an audible-signal circuit, a magneto generator in the circuit, and means controlled by the shaft to operate the generator.



NO. 775,337.—WIRELESS-TELEPHONE SYSTEM.

775,521. Telephone System. George M. Crockett, New York, N. Y., assignor of one-half to Irving H. Brown, Plainfield, N. J. Application filed June 19, 1903.

A relay at one sub-station is connected with the corresponding telephone instruments and with one of the main lines arranged to break the circuit at its station or the station or stations farther on the line from central upon the closing of the circuit of the telephone instruments at the corresponding station.

775,529. Electrically Operated Railway Track Switch. George H. Fretts, Springfield, Mass. Application filed January 20, 1904.

Insulated conductors support a trolley switch insulated therefrom. Electrical trolley-switch-actuating mechanism is adapted to be energized by a current established through the trolley. Electrical track-switch-actuating

mechanism has means for causing the energizing of the mechanism simultaneously with the trolley-switch-actuating mechanism when the insulated conductor sections are energized by the trolley.

775,535. System of Alternating-current Distribution. Adolf E. W. Meissner, Charlottenburg, Germany. Application filed June 16, 1899.

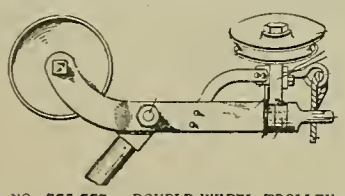
A pair of rotary transformers has means for supplying current thereto and mechanism for varying the relative speeds of the transformers. A rotor is supplied with alternating current from one transformer, and a stator supplied with current from the other transformer.

775,560. Oscillating Motor. Theodore M. Foote, New York, N. Y. Application filed March 17, 1904.

The motor comprises a shaft suitably journaled, an arc-shaped core carried by the shaft, a series of windings inclosing the core and means whereby the windings may be successively energized. A field magnet causes the core and shaft to rotate upon the energization of the windings.

775,592. Insulating Support for Electric Third Rails. Walter H. Barnard, New York, N. Y. Application filed July 28, 1904.

An insulating support for electric-conductor rails comprises a base, an insulating block secured thereon and a rail-receiving clamp secured on the block and movable around it.



NO. 775,777.—DOUBLE-WHEEL TROLLEY.

775,627. Overhead Trolley. Joseph G. Johnston, Detroit, Mich., assignor to the American Car and Foundry Company, St. Louis, Mo. Application filed September 9, 1904.

Two inclined rails having alining ends in different horizontal planes have a hoist adjacent the ends of the rails to receive the trolley from one rail and transfer it to the other rail. A trigger forces the trolley from the hoist, and an abutment is provided against which the trigger strikes when the trolley is in position to be transferred to one of the rails.

775,654. Electric Furnace. Aldus C. Higgins, Worcester, Mass. Application filed April 4, 1904.

An electric furnace is comprised of a shell adapted to contain and come in contact with the material to be fused, and a base separable from the shell upon which the charge is entirely supported when the shell is removed.

775,665. Circuit Controller. Archibald D. Scott, Providence, R. I., assignor to the Varley Duplex Magnet Company. Application filed November 6, 1903.

A pivoted lever having a flexible extremity is associated with a contact point opposed to the extremity. A stop normally holds the lever out of contact with the point and means are provided for violently throwing the lever against the stop to create momentum in the flexible extremity. Other means prolong the contact thus produced between the lever and the contact point.

775,680. Resonance Relay. Peder O. Pedersen, Copenhagen, Denmark. Application filed July 31, 1901.

The relay consists of a pair of oppositely arranged tuning forks, vibrators stretched between the forks and located in a magnetic field, and a contact device controlled by one of the tuning forks.

775,689. Base for Incandescent Lamps. Alfred Swan, New York, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed March 27, 1903.

A base for an incandescent lamp comprises metallic contacts to which the lamp wires are attached, and a metallic bulb holder secured to, but insulated from, the contacts by glass, the bulb holder having a flange formed thereon which is embedded in the glass.

775,692. Electromagnetic Circuit Controller. Eugene W. Vogel and Charles H. Morrison, Chicago, Ill., assignors to the Railroad Supply Company. Application filed March 21, 1902.

Details are described.

775,714. Electric Heater. Edward P. Weggen, Jefferson City, Mo., assignor of two-thirds to Charles Tweedie, Jefferson City, Mo., and William J. Schott, Topeka, Kan. Application filed April 22, 1904.

A coil is disposed adjacent to the member to be heated, the coil being provided with windings, and conductors connected with one of the windings at points remote from the member to be heated. The points are selected from different parts of a winding remote from the member to be heated for the purpose of rendering uniform the distribution of heat.

775,723. Electric Burglar Alarm. Amos Getto, New York, N. Y. Application filed April 27, 1904.

A member is connected rigidly upon a spindle to be turned to different angles. Contact mechanism is mounted upon the member and opened and closed by movements of the member. Electric circuits are connected with the contact mechanism, and a bell is included within the circuit and energized thereby.

775,732. Battery-charging Apparatus. Hermann G. Pape, New York, N. Y. Application filed May 17, 1904.

In a battery-charging apparatus are combined a charging cord having a single connector provided with terminals of like form, a battery having a single connector provided with terminals of like form, but unlike the terminals of the cord connector and arranged to be connected in interfitting relation therewith, and a polarity indicator having a pair of terminals corresponding in form with the terminals of the battery connector, the polarity indicator and each connector having a terminal indicator to facilitate the proper connection of the parts.

775,736. Electric Signaling System for Railways. Emilio Sera and Floriano Stolfi, New York, N. Y. Application filed July 18, 1904.

In an electric signal system are an open circuit, electric batteries and signaling devices in the circuit, and pole-changing devices in the circuit, the pole-changing devices being adapted to change the poles of the batteries at different intervals.

775,752. Manufacture of Barium Hydrate. Fredrik Jahn, Ridley Park, Pa., assignor to Harrison Bros. & Co., Philadelphia, Pa. Application filed September 5, 1903.

A process of obtaining barium hydrate from barium sulfid consists in electrolyzing a solution of the latter between electrodes of which the anode is larger than the cathode with interposition of a porous partition whereby some of the barium hydrate is formed in the cathode compartment while the remainder and greater part is formed along with polysulfids in the solution in the anode compartment.

775,777. Trolley. Edward L. Naret and Joseph R. Ernst, Morgantown, W. Va. Application filed September 16, 1904.

The trolley is comprised of two wheels following the wire, one in a horizontal and the other in a vertical plane. (See cut.)

775,779. Rosette for Suspending or Supporting Incandescent Lamps. Harry E. Rossiter, Sunbury, Pa. Application filed June 2, 1904.

A base member and a cap member, the two having metallic spring and plate connections between, are adapted to support an incandescent lamp. The base member has a socket provided with a lateral entrance and undercut opposite walls. The cap member has opposite walls adapted to extend within the planes of the undercut walls.

775,797. Railway Signaling Apparatus. John T. Cade, Midland township, Bergen County, N. J., assignor to the General Railway Signal Company, Gates, N. Y. Application filed October 6, 1902.

A counterweight is arranged to throw the signal to danger when released and a motor controlled from the signal tower brings the signal back to "clear."

775,808. Trolley. Joseph B. Elker and James F. Tobin, Pittsburg, Pa. Application filed January 26, 1904.

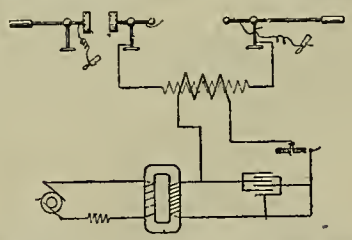
A casing is secured to the pole and a trolley wheel is resiliently mounted and extends within the casing.

775,830. Typewriting Machine. George M. Kitzmiller, Norfolk, Va., assignor to the Electric Typewriter Company of Norfolk, Norfolk, Va. Application filed August 4, 1904.

Electromagnetic means, controlled by the key levers, manipulate the printing devices.

775,834. Electromagnetic Brake. Robert C. Lowry, New Westminster, Canada. Application filed August 13, 1903.

In an electromagnetic brake are a bar or bars pivotally arranged, a suspending device and one or more brake wheels mounted at each end of the bars and adapted to be brought into contact with the magnetized car wheels.



NO. 775,871.—VARIABLE AIR-GAP CONDENSER.

775,835. Electromagnetic Brake. Robert C. Lowry, New Westminster, Canada. Application filed August 13, 1903.

In an electromagnetic brake are a bar arranged between the wheels and non-magnetic brake shoes carried by the bar, the ends of the bar being adapted to come in direct contact with the peripheries of the wheels.

775,844. Electric Time Switch. Clifford S. Moore, Holyoke, Mass., assignor of one-half to Burton C. Read, Holyoke, Mass. Application filed December 23, 1903.

The essential parts are a movable actuating member of a switch, a slidable member connected to the movable member, a weight arranged to co-operate with the slidable member, a swinging lever having a weight-supporting abutment, a detent for the lever, and a clock-actuated part, arranged to trip the detent at a predetermined time.

775,846. Wireless Telegraph. Robert L. de Moura, New York, N. Y. Original application filed October 4, 1901. Divided and this application filed January 16, 1902.

A transmitting apparatus comprises a set of Hertz-wave antennæ, a source of cathodic waves, and a source of actinic waves, means whereby the changes of a prearranged code may be impressed on one or more of the sets of waves, and means for directing all the waves to a distant station. (See cut.)

775,857. Dynamo-electric Machinery. Henry G. Reist, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Original application filed May 9, 1902. Divided and this application filed May 18, 1903.

In combination with the shaft of a main dynamo are an auxiliary dynamo provided with a shaft operatively connected to the first-mentioned shaft, a support for the auxiliary machine eccentrically mounted with respect to its shaft whereby the distance between the two shafts may be varied by rotating the support, and means allowing a rotation of the field of the auxiliary machine with respect to its shaft and to the support.

775,867. Trolley. William S. Stockton, Philadelphia, Pa. Application filed August 18, 1904.

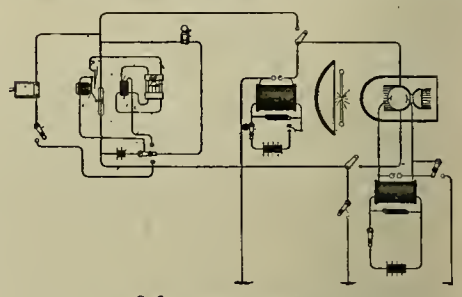
Details are described.

775,869. Portable High-frequency Apparatus. Frederick F. Strong, Boston, Mass. Application filed May 23, 1904.

A portable high-frequency apparatus has all its different sets of mechanism constructed as separate units independently removable and provided respectively with plate contacts for automatic electrical connection in proper relation when the separate units are placed in the cabinet.

775,870. Portable High-frequency Apparatus. Frederick F. Strong, Boston, Mass. Application filed May 23, 1904.

A high-frequency apparatus consists of a transformer, condenser, high-frequency-coil primary and high-frequency-coil secondary, having all of the parts concentrically and compactly arranged.



NO. 775,846.—SPACE-TELEGRAPH SYSTEM.

775,871. Variable Air Gap Condenser. Frederick F. Strong, Boston, Mass. Application filed May 23, 1904.

The apparatus comprises means for producing a current of excessively high frequency, an applying electrode and a convective discharge means in series therewith between the electrode and the producing means for interposing in the current a convective spray discharge, thereby modifying the current for therapeutic work. (See cut.)

775,872. Rotary Spark-gap. Frederick F. Strong, Boston, Mass. Application filed May 23, 1904.

The device comprises a fixed disruptive discharge electrode, a rotary electrode co-operating therewith, and arc-producing means in series therewith located adjacent the electrodes.

775,891. Apparatus for Generating Electric Currents. Charles S. Bradley, Avon, N. Y. Application filed September 11, 1897.

An alternating-current induction generator driven by a prime mover, a speed-varying device for the latter, and control devices for increasing the speed of the generator above synchronism by an amount corresponding to the ordinate of the torque curve of the generator at any particular load are the essential parts.

775,892. Galvanic Element or Battery. Paul Brandt, Schöneberg, near Berlin, Germany. Application filed April 20, 1904.

Combined with a positive-pole electrode, and a negative-pole electrode surrounding the former, are a connection between the two electrodes, located at the lower ends, an isolating layer having the connection embedded in it, another layer of an isolating material situated upon the element, and a comparatively large filling aperture in the upper layer.

REISSUE.

12,286. Plural Lamp Socket. Reuben B. Benjamin, Chicago, Ill., assignor to the Benjamin Electric Manufacturing Company, Chicago, Ill. Application filed August 25, 1904. Original application filed May 17, 1904.

A plural lamp socket having a number of lamp-holding devices forms the basis of the patent.

EXPIRING PATENTS.

Following is a list of electrical patents (issued by the United States Patent Office) that expired on November 29, 1904:

373,859. Regulator for Electric Generators. R. P. Sellon and William M. Mordey, Victoria Works, Belvedere Road, County of Surrey, England.

373,862. Mechanical Telephone. J. P. Sunderland, Brooklyn, N. Y.

373,883. Application of Accumulators to Electric Lighting. T. P. Conant, Brooklyn, N. Y.

373,910. Telephone Call Box. C. E. Schribner, Chicago, Ill.

373,915. Induction Telegraph System. G. T. Woods, Cincinnati, Ohio.

373,925. Telegraph Pole Protector. H. P. Copeland, East Orange, N. J.

373,934. Electric Arc Lamp. C. A. Homans, Winchester, Mass.

373,948. Winding Armatures of Dynamo-electric Machines. C. E. Schribner, Chicago, Ill.

373,967 and 373,968. Telegraphy. P. B. Delaney, New York, N. Y.

373,971. Commutator Connection for Dynamo-electric Machines. J. W. Easton, New York, N. Y.

373,975. Electrical Horometer. B. M. Hammond, San Antonio, Texas.

374,013. Electrical Indicator for Weighing Scales. J. E. Tarbox, Lynn, Mass.

374,017. Automatic Circuit-Opener. J. P. Tirrell, Somerville, Mass.

374,028. Electric Door Opener. A. C. Wochrle, New York, N. Y.

374,038. Telegraph Instrument. C. G. Burke, Richmond Hill, N. Y.

374,088. Electric Organ Action. H. L. Roosevelt, New York, N. Y.

374,103. Manufacture of Telegraph and Other Poles or Posts. D. Wilson, County of Essex, England.

374,120. Arc Light. C. B. Noble, Cleveland, Ohio.

374,072. Electric Temperature Regulator. W. S. Johnson, Milwaukee, Wis.

WESTERN ELECTRICIAN

EVERY SATURDAY

Vol. XXXV. CHICAGO, DECEMBEP 10, 1904 No. 24

Betterments of the Chicago and Milwaukee Electric-railway System.

During the last year the Chicago and Milwaukee Electric Railway Company has done much to improve and extend its system, about $1,000,000 having been expended in laying new track, widening the roadbed and enlarging the power plant. This system at present comprises one of the most important interurban lines in the vicinity of Chicago, and the work of extension is not yet completed, for it is the intention of the company ultimately to extend the line to Milwaukee, a distance of about 75 miles from Evanston, Ill., the present southern terminus of the road.

The Chicago and Milwaukee electric railway has been in operation for a number of years and the system was described quite elaborately in the Western Electrician of October 21, 1899. The great impetus which has been given to its development recently, however, furnishes much which will be of interest at the present time.

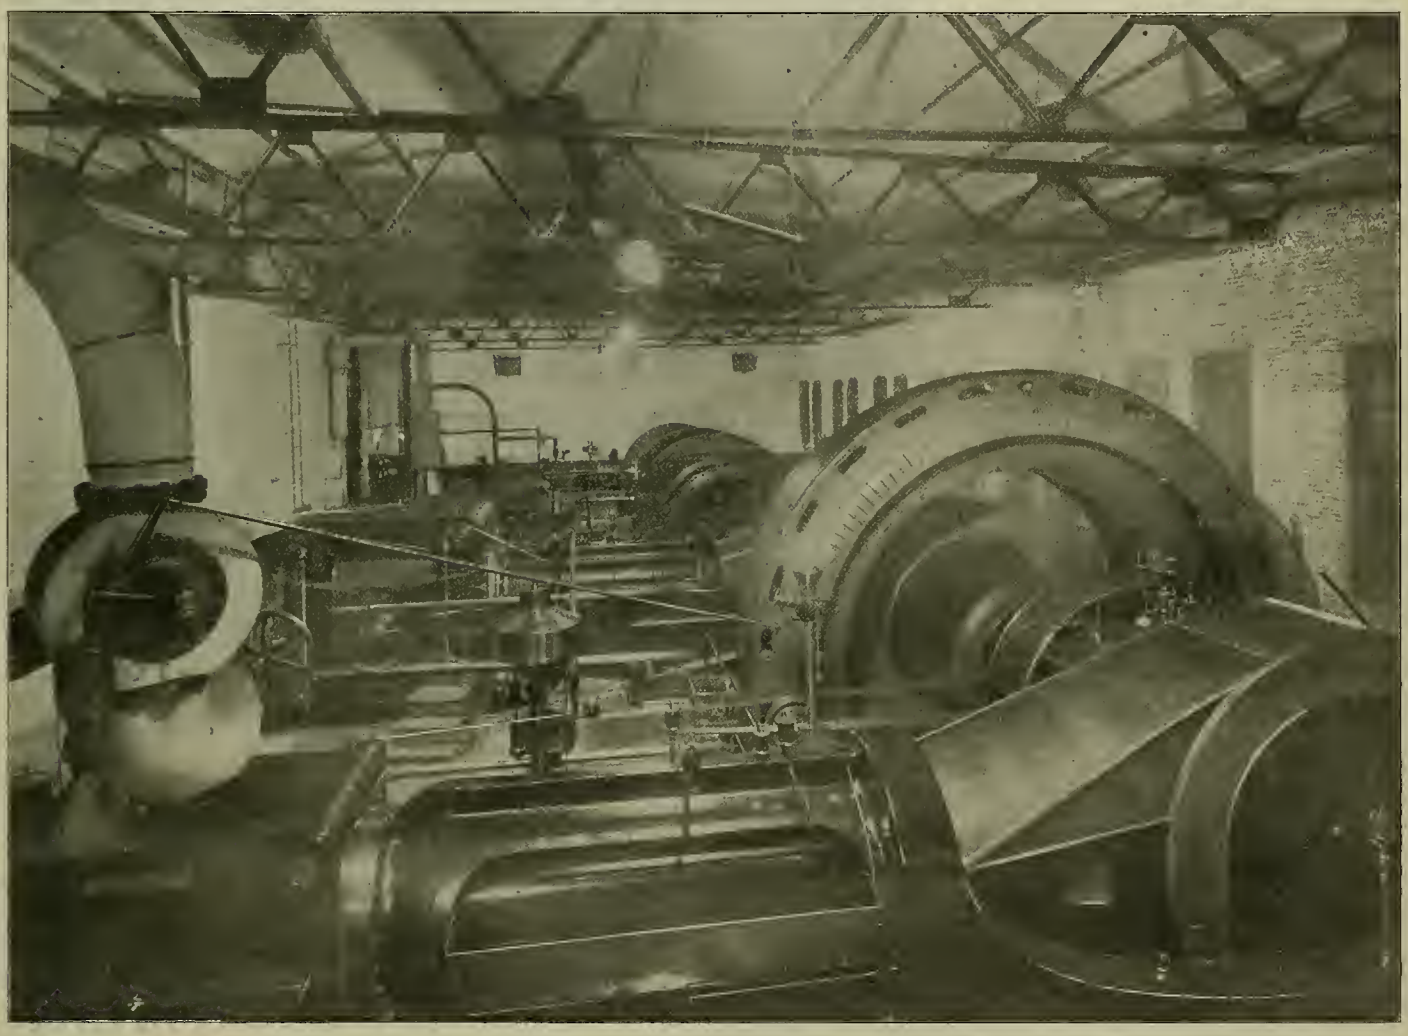


FIG. 1. BETTERMENTS OF THE CHICAGO AND MILWAUKEE ELECTRIC-RAILWAY SYSTEM.—INTERIOR OF ENGINE ROOM IN POWER PLANT AT HIGHWOOD.

Fig. 2 is a small map indicating in a general way the location of the line, the map not having been drawn to scale, however. On the map, also, the line is indicated as reaching the heart of Chicago, though as yet connections have not been made to allow of this. From the center of Evanston the road now extends north to Llewellyn Park, Wilmette, Kenilworth, Winnetka, Lakeside, Glencoe, Ravinia, Highland Park, Highwood, Fort Sheridan, Lake Forest, Lake Bluff, North Chicago and Waukegan. There is also a branch connecting with the main line at Lake Bluff running west through Rondout and terminating, for the present, at Libertyville, which, with the connection now planned with the Northwestern elevated railroad, will enable the Chicago and Milwaukee Electric Railway Company to give these 17 towns quick and frequent service to the business center of Chicago. Though the manner in which this connection is to be accomplished has not been stated definitely, it has been thought by many that recent application of the Chicago, Milwaukee and St. Paul steam railroad for a franchise to connect with the Northwestern Elevated road, is a forerunner of the movement to get the Chicago and Milwaukee electric road admission to the city and that the franchise when obtained will be sublet to the electric road.

The territory through which the electric road operates is among the finest adjacent to Chicago, practically all of the towns being suburbs of Chicago and rapidly increasing in population. Between each suburban town there is at present an open country district, which, from present indications, will eventually be divided into country estates or suburban homes to such an extent that the territory traversed by the road, at least as far north as Waukegan, will be one continuous residence district. Educational advantages along the route are particularly good. Northwestern University is located at Evanston; Northwestern Military Academy at Highland Park; Lake Forest University, with its affiliated preparatory schools at Lake Forest, and there are at least eight private schools, all in flourishing condition, located along the line. Country clubs are numerous and well supported, there being eight now established within reach of the electric road. Fort Sheridan, a military post of considerable size, attracts many visitors, and near Fort Sheridan there has been established a pleasure resort known as Fort Sheridan Park.

Farther south on the line from Fort Sheridan at Ravinia is located Ravinia Park, owned and operated by the electric-railway interests. This park is somewhat out of the ordinary in the line of amusement resorts operated by electric railways in that it furnishes attractions both summer and winter. Here, besides the park itself, are a theater, a casino and a stadium. The theater seats about 1,100 people and contains a well-equipped stage and a large pipe organ. Throughout the fall performances are given every evening, and during the winter twice a week. The stadium is a steel structure seating 2,000 people and facing an open field for athletic sports. Thus there are furnished attractions for patrons of the electric line for the whole year instead of for the summer months only, as is the case with most parks which are run in connection with interurban lines.

Roadbed and Overhead Construction.

The road as it now stands is the equivalent of about 70 miles of single track, built partly on private right-of-way and partly on public roads. By glancing at the map the following explanations will be clear: About three-fourths of the road from Evanston to Waukegan is laid over private right-of-way. From Evanston to Lake Forest is all double track. From Lake Forest to Waukegan but a single track is now operated, though a second track is being laid. At Lake Bluff, however, construction has been commenced for a four-track roadbed, which will be ultimately extended in both directions to the ends of the line, making the line the first four-track electric interurban railway in the United States. Fig. 8 is a view of this construction at Lake Bluff, showing the widening of the roadbed and a short strip of double track at this point which, however, does not at present extend to Lake Forest, where the double track properly ends, as already stated.

The Libertyville division extends from Lake Bluff in a westerly direction through Rondout to Libertyville, a distance of about six miles, as shown in Fig. 2. Work is now under way also on an extension west from Libertyville to the new town of Rockefeller,

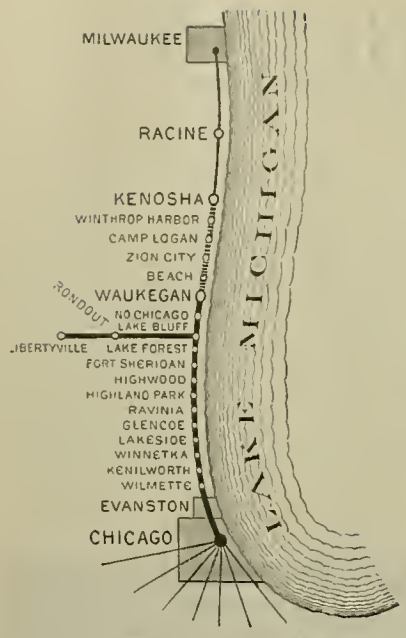

FIG. 2. MAP OF TERRITORY SERVED BY CHICAGO AND MILWAUKEE ELECTRIC RAILWAY.

which is just springing up on the line of the Wisconsin Central steam road. At Lake Bluff the Libertyville division divides. One branch extends north to North Chicago, a distance of three miles, paralleling the main line, but on the opposite side of the Chicago and Northwestern railroad. The two tracks of this branch, together with the double track of the main line, when completed, will form a section of the ultimate four-track line. The second part of the Libertyville division joins the main line at Lake Bluff, but before doing so dips underneath the tracks of the Chicago and Northwestern through the subway, which is shown in Fig. 9.

Looking at Fig. 9, a glimpse may be caught of a second subway in the background, which is for the accommodation of a wagon road under the main line of the electric road, avoiding a grade crossing at that point. The subway and approaches under the Chicago and Northwestern were constructed at a cost of approximately $40,000. Just west of Lake Bluff a deep cut of about 160,000 cubic yards was made in order to obtain easy grade for the trains leaving the subway.

At Rondout, on the Libertyville division, the company has built heavy concrete abutments and heavy through-girder bridges to cross over the tracks of the Elgin, Joliet and Eastern railway, and the main line of the Chicago, Milwaukee and St. Paul railroad, in order to avoid a grade crossing. Approaches to these bridges are built on a grade of less than one-half of one per cent. and contain about 200,000 cubic yards of filling.

Sixty-five-pound T-rail is used on private right-of-way throughout the system and 85-pound steel girder rail where the road is in a street. The track is all laid on standard first-quality white-oak ties, with iron and concrete culverts, stone and concrete abutments and retaining walls, and steel viaducts and bridges. The work done during the last two years is of a high grade of standard steam-railroad construction.

The overhead construction is of the most modern and substantial kind, using wood and iron poles, and No. 00 trolley wire with secondary feeders of 300,000 and 500,000-circular-mil cross-section. High-tension transmission lines, consisting of No. 4 and No. 0 wire extend from the power house at Highwood in each direction, so arranged that the transmission circuits are in duplicate, thus providing for temporary breakdowns and future extensions. All of the insulation of the high-tension lines is designed to carry a working pressure of 13,200 volts.

FIG. 3. EXTERIOR OF POWER PLANT AT HIGHWOOD, WITH CAR BARNS ON RIGHT.

Power Plant.

Power for the Chicago and Milwaukee electric railway is generated in one central plant located at Highwood, some distance north of the center of the system. Here are also located a car barn, repair shops and office building, all contained on a seven-acre tract of land. Fig. 1 is an interior view of the generator room of the power plant as seen from the switchboard gallery. In the foreground of the picture is shown the largest generating unit, which

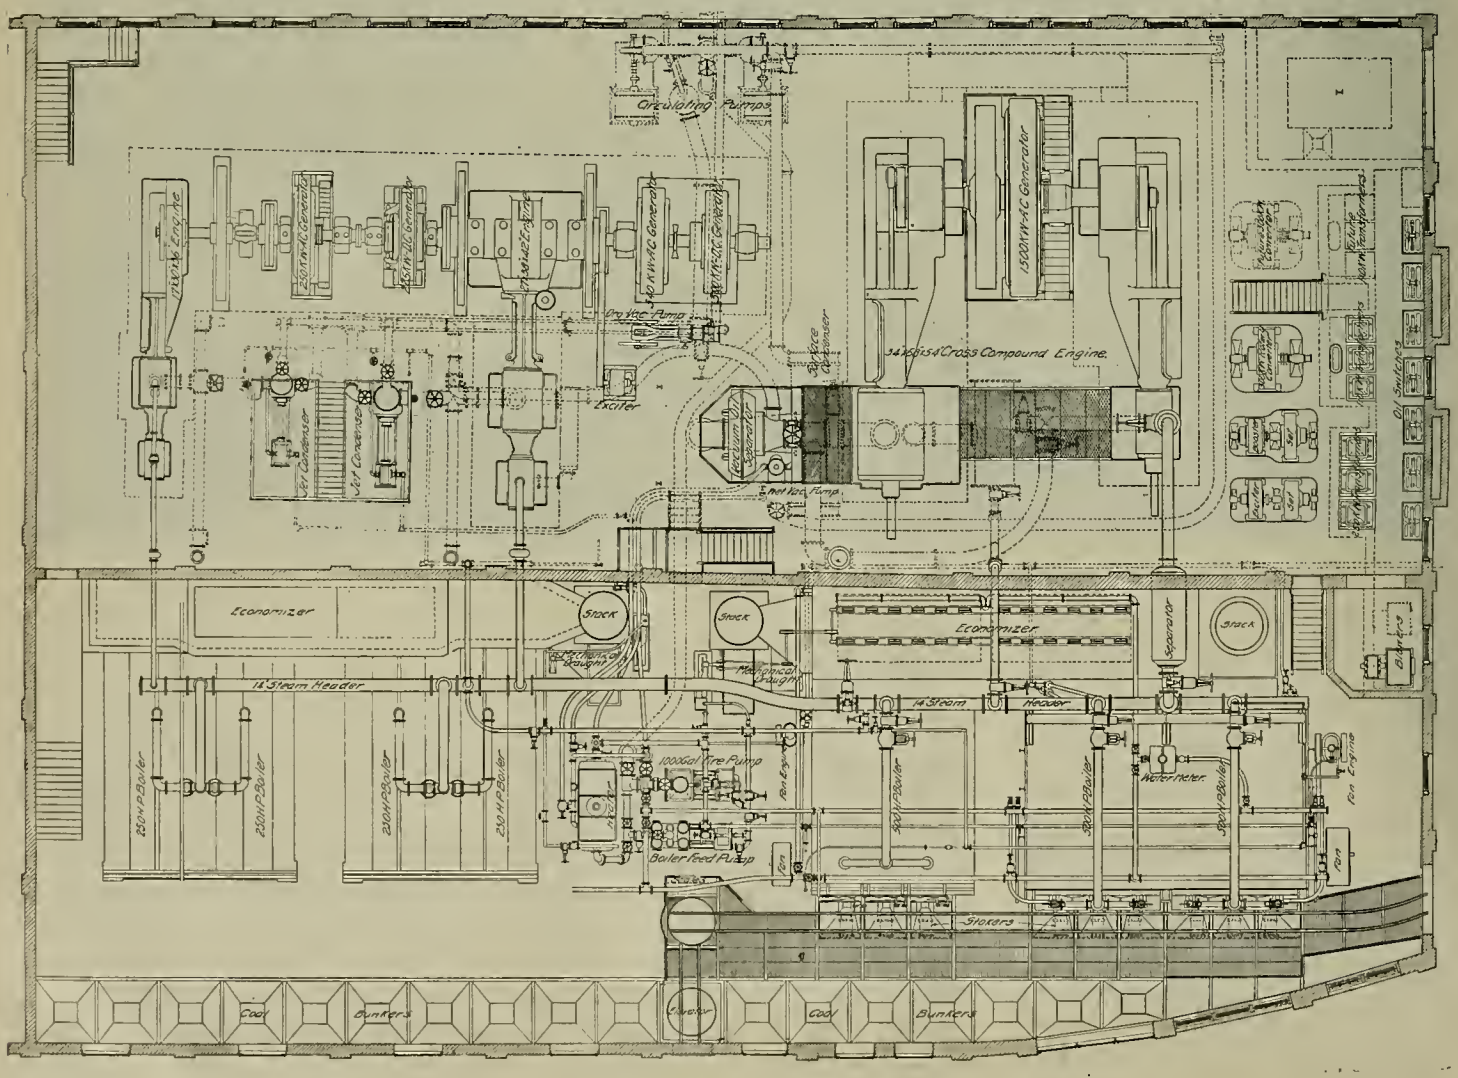

FIG. 4. PLAN OF POWER HOUSE OF CHICAGO AND MILWAUKEE ELECTRIC RAILWAY AT HIGHWOOD.

consists of a 1,500-kilowatt alternating-current 13,200-volt three-phase generator, which furnishes current direct to the transmission lines. This generator is direct connected to a 34 by 68 by 54-inch cross-compound condensing engine.

On the other side of the main generator there are two other sets, consisting, respectively, of a 250-kilowatt alternating-current and a 225-kilowatt direct-current generator direct connected to a 17 by 30 by 36-inch engine, and a 540-kilowatt alternating-current and a 300-kilowatt direct-current generator direct connected to a 34 by 68 by 54-inch engine. The old direct-current switchboard is mounted back of the two smaller generating sets. All the generators mentioned were manufactured by the General Electric Company and the engines by the Filer and Stowell Company of Milwaukee.

Other electrical apparatus located in the power house is indicated in Fig. 6, which is a view showing the alternating-current switchboard, the lightning arresters, mounted above the board, the oil switches, transformers, rotary converter, exciter set and booster. Fig. 7 is a wiring diagram of the station which, with the exception of a few minor details, represents the connections as they now are, while Fig. 4 is a plan of the power house. Fig. 5 is a cross-section of the power house. By studying these three

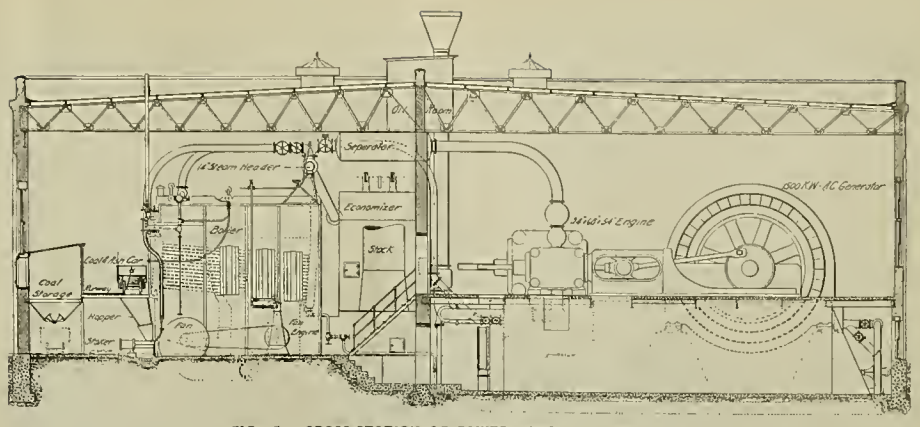

FIG. 5. CROSS-SECTION OF POWER HOUSE AT HIGHWOOD.

FIG. 6. SWITCHBOARD, OIL SWITCHES AND TRANSFORMERS IN HIGHWOOD.—POWER PLANT OF CHICAGO AND MILWAUKEE ELECTRIC RAILWAY.

diagrams carefully a very good idea may be obtained of the general layout of the station.

The switchboard, as shown in Fig. 6, consists of 16 panels. It contains panels for the high-tension feeders, exciter panels, generator panel for the larger machine and two spare panels. Beneath the switchboard and against the rear wall are seven oil-break switches for the high-tension circuits. They have a capacity of 300 amperes each.

Six transformers are located underneath the switchboard. Three of these may be seen in the picture and are of 110-kilowatt capacity each. They operate in conjunction with a 300-kilowatt rotary converter, which is the largest of the three machines shown in Fig. 6. The other two machines shown in this picture are an exciter set and booster set. Beyond the three transformers mentioned are three others of 250 kilowatts each, which step the pressure of the two smaller alternating-current generators previously mentioned up to the 13,500 volts of the transmission line.

Steam is generated in a boiler plant containing four 250-horsepower Aultman & Taylor boilers equipped with Hawley down-draft furnaces, two 500-horsepower Edgemoor water-tube boilers equipped with Jones automatic stokers, and one 500-horsepower Babcock & Wilcox water-tube boiler, also equipped with a Jones automatic stoker.

The plant contains modern coal and ash-handling apparatus and economizers. Cooling water for the condensers is obtained by the use of two cooling towers, which are shown in Fig. 3, which is an exterior view of the power plant. The condensing water is contained in a large reservoir shown in the foreground of this picture.

In a separate building from the main power house is located a 288-cell storage battery for reducing the fluctuations of the load, the tanks being constructed of sufficient size to allow of a 55 per cent. increase. The battery was furnished by the Electric Storage Battery Company.

Sub-stations.

There are three sub-stations located along the line, at Winnetka, Libertyville and North Chicago, where the 13,200-volt three-phase current from the transmission lines is reduced to 500-volt direct current for the operation of the cars; for several miles each side of Highwood the direct-current generated at the main power house is used.

The sub-station at Winnetka contains two 500-kilowatt rotary converters, six 185-kilowatt stationary transformers and four remote-control oil switches. There are also a storage battery of 288 cells and a booster having a capacity of 470 amperes at 60 volts.

Libertyville sub-station and passenger "depot" is shown in Fig. 10. It contains, besides the electrical apparatus, a waiting room and lunch room, with apartments above for the man in charge. The apparatus installed in this station consists of one 300-kilowatt rotary converter and three 110-kilowatt transformers. This building is of pressed brick and was constructed at a cost of $15,000. At North Chicago is located the newest sub-station of all. This contains two 300-kilowatt rotaries, six 110-kilowatt stationary transformers and a 288-cell storage battery, besides a 28-kilowatt booster.

Car Equipment and Operation.

The equipment of the line consists of 23 closed double-truck passenger cars. Seven of these are equipped with four 50-horsepower motors and six with four 75-horsepower motors. The cars are from 38 to 51 feet long over all and seat 40 to 48 passengers. There are also 25 double-truck open passenger cars, seating 56 passengers each; two double-truck express cars, 38 feet over all; one rotary snow-plow; one large snow-sweeper; 12 flat cars; five steam locomotives, and 43 side and center-dump gravel cars. In Fig. 3 are to be seen a number of the latest type of cars upon the road. In addition to the above equipment, the Chicago and Milwaukee Electric Railway Company has bought all the rolling stock of the Intramural railway of the Louisiana Purchase Exposition Company.

All of the company's buildings are substantial and of practically fireproof construction. During the last year the company has built a number of waiting stations of artistic design along its lines. The company owns extensive gravel beds along its line at Libertyville, and this gravel is in great demand for macadamizing streets and concrete work in the 15 towns along the company's line from Evanston to Waukegan, and an extensive business is developing in this direction.

The Libertyville division, as stated, is built for heavy freight and passenger traffic, connecting at

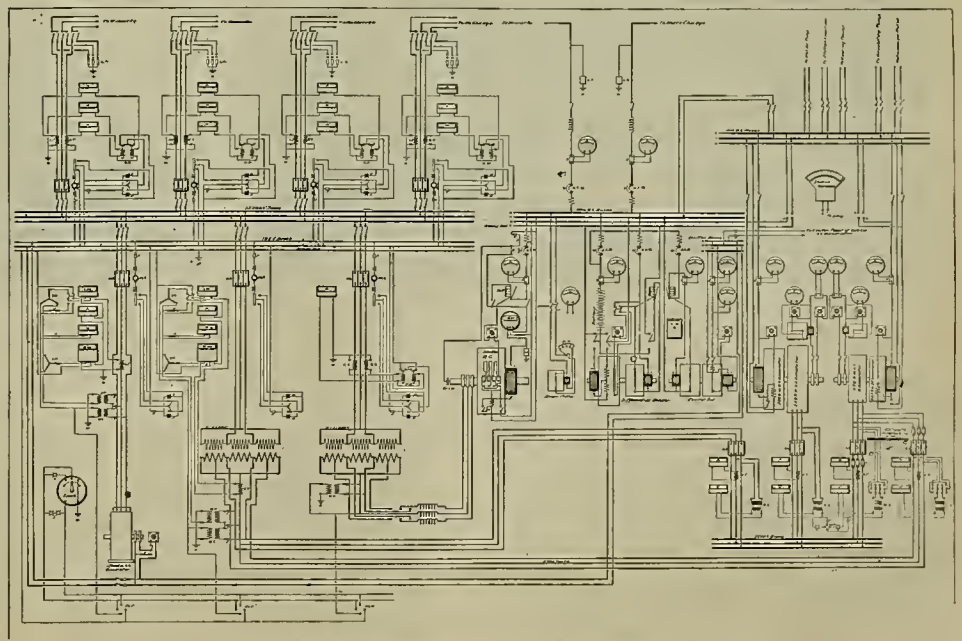

FIG. 7. DIAGRAM SHOWING WIRING CONNECTIONS AT HIGHWOOD POWER PLANT.

Rondout with the Elgin, Joliet and Eastern and the main line of the Chicago, Milwaukee and St. Paul railroad, and when extended to Rockefeller will connect there with the Wisconsin Central railroad. Freight, therefore, on the St. Paul or Wisconsin Central roads which is destined for points along the electric line may be readily transported across over the Libertyville branch, and will not be compelled to go to Chicago and then be brought back over the Chicago and Northwestern.

EXTENSIONS.

Extensions of the road are planned from Waukegan on up through Kenosha and Racine to Milwaukee, though whether this will be done independently by the Chicago and Milwaukee electric road or in conjunction with existing lines is not yet determined. This much is assured at least, that the company will build over its own right-of-way as far as Kenosha. All the new work will be four-track construction, and the single-phase system will be put in operation north of North Chicago. What single-phase system this will be has not as yet been determined, but it will be one which will allow of the cars operating also over the direct-current lines.

While this road is the outgrowth of a small road originally extending between North Chicago and Waukegan, which was added to by the construction of a road between Highland Park and Fort Sheridan, and eventually connecting the two together by single track, all of which was of more or less pioneer construction, the character of the territory through which the road passes and the development of the business of the road has been such as to warrant almost the entire reconstruction of the original road, so as to make it conform to the class of work done during recent years.

The officers of the company are: President, A. C. Frost; vice-president, H. S. Oakley, and secretary and treasurer, G. M. Seward. The general offices are in Chicago.

The engineering work upon this system is in the hands of the Arnold Electric Power Station Company of Chicago, the electrical end being under the direct supervision of Mr. W. A. Blanck at Highwood.

FIG. 8. EXAMPLE OF WIDENED ROADBED OF CHICAGO AND MILWAUKEE ELECTRIC RAILWAY AT LAKE BLUFF.

St. Louis Exposition Is Closed.

At midnight on December 1st the great Louisiana Purchase Exposition at St. Louis was brought to a close. Electricity, which all through the Exposition had been prominent, likewise was the distinctive agency in the closing ceremonies. The last day had been designated as Francis Day in honor to President Francis of the Exposition, and many expressions of esteem and appreciation were made in recognition of the work of the man who so successfully directed the great Fair.

Promptly at 12 o'clock midnight President Francis, surrounded by a crowd estimated at 100,000 persons, threw a switch which had been arranged at the foot of the Louisiana Purchase Monument, and slowly, as though reluctant to lose its beauty, the grand illumination dimmed. Simultaneously the current which operated the Cascades was cut off, and, with the darkening of the main picture, the beautiful torrents of foaming water were forever silenced.

The work of dismantling the buildings began immediately following the close, and within two weeks, it is estimated, all the exhibits may be removed from the grounds. Representatives of the Lewis and Clark exposition to be held in Portland, Oregon, next year were present and selected many exhibits to be sent west. Negotiations for the sale of the property of the exposition itself, it is said, have been closed with the Chicago House Wrecking Company, which concern, it is said, for a consideration of $386,000, comes into possession of the 11 big exhibit palaces, stock barns, festival hall, the colonnade of states, pavilions, aerodrome, bank, intramural railway, hospital, press buildings, electrical construction, police and fire stations, with other World's Fair structures that cost $15,000,000. Everything except the rolling stock of the intramural, which has been sold separately, the state, foreign and Pike buildings, are included in the deal.

The official figures of the attendance at the St. Louis fair have been made public, and place the total attendance for the 187 days of the Exposition at 18,741,073. The attendance of the closing day was 203,101. Those who registered at the booth of the Western Electrician during the last week of the fair were the following-named: Harry E. Dyer, Western Electric Company, Chicago; Charles J. Quinn, Brooklyn; B. H. Lage, New York; Dr. C. C. Quale, Chicago; O. C. Quale, Kirkhaven, Minn.; Charles W. Cary, Denver, Colo.; Julius M. Foster, Santiago, Chile, S. A.; George Steppe, St. Louis; E. Zimmerman, St. Louis.

Lewis and Clark Centennial Exposition.

BY FRANK L. MERRICK,
Manager General Press Bureau.

Out in the Pacific Northwest, 2,000 miles from the biggest of world's fairs, which has now faded into history, a smaller but none the less beautiful exposition is building—the Lewis and Clark Centennial at Portland, Ore., to commemorate the 100th anniversary of the exploration of the Oregon country by Captains Meriwether Lewis and William Clark.

This western world's fair will be a gem of artistic beauty and grace, placed in a unique setting, the like of which has never before been conceived. Occupying 402 acres adjoining the principal residence section of Portland, on the gentle slopes and terraces overlooking Guild's Lake and the Willamette River, with the snow-capped peaks of Mt. Hood and Mt. St. Helens in the distance, the site presents a picture of nature entirely original in exposition building.

For compactness and attractiveness of feature and environment the exposition will be without question the greatest fair ever held.

It can be seen, studied and comprehended within the means and time that the average person has at his disposal. There will be no dreariness of architecture to tire the eye, no long miles of aisles to weary and ache the limbs, no hot summer days or nights to sap one's vitality, no burning winds sweeping over a dry plain to enervate and depress the visitor, no roads that will alternately be dust or mud, according to atmospheric conditions. All will be perfection, or at least the nearest approach thereto ever achieved by an exposition. Man's genius and nature's endowments work hand in hand in the making of the Centennial Exposition. What man could not do, nature has done; what nature left undone, man has accomplished. Engineering skill has smoothed hillocks, leveled depressions, rounded off sharp corners, rooted out knotted trunks of trees, aligned the lake shore, covered the old forest floor with the verdure of the Pacific West, and molded the exposition grounds into a bower of beauty.

Nature's contribution to the scene will of itself compensate any sight-seer for a trip to the exposition. At St. Louis a syndicate of capitalists spent several hundred thousand of dollars upon a feature known as the "Tyrolean Alps." To this people paid an admission for the purpose of refreshment and gazing upon imitation mountains. The visitor to the Centennial Exposition may, without extra charge, sit among the shade trees in Centennial Park, and look upon the sublime peaks of the Cascade range, and enjoy more real scenery in one minute than all the Tyrolean Alps creations have to offer.

Of the gross area of the site, 180 acres is on the mainland and 60 acres forms a peninsula extending out into Guild's Lake. This lake is a fresh-water body 220 acres in extent, separated from the Willamette River by a narrow strip of land. The main

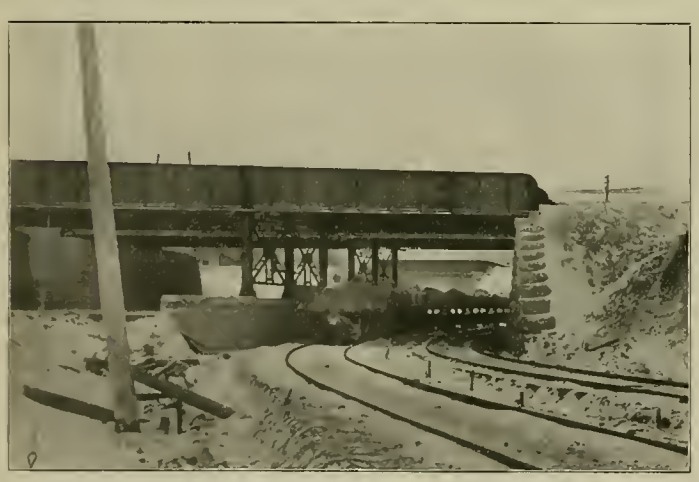

Fig. 9. Subway Under Chicago and Northwestern Tracks at Lake Bluff.

Fig. 10. Combined Sub-station, Waiting Rooms and Dwelling at Libertyville.

BETTERMENTS OF THE CHICAGO AND MILWAUKEE ELECTRIC RAILWAY SYSTEM.

exposition structures occupy the ground bordering upon the lake. Eight large exhibit palaces, marvels of symmetrical beauty in design, form the "main picture." These buildings, some of which are finished and others rapidly nearing completion, are: (1) Agriculture, (2) Liberal and Industrial Arts, (3) Foreign Exhibits, (4) Forestry, (5) Fine Arts, (6) Mines and Metallurgy, (7) Territorial Building, and (8) Machinery, Electricity and Transportation. Around these on the outer edge cluster the state, territorial and other minor pavilions. The Administration Building, where the executive offices of the Fair will be located, is situated at one end of the beautiful colonnade entrance.

Many states will erect pavilions, among them being Oregon and Massachusetts. The Oregon Building, which will be a handsome club house of the colonial design, holds a commanding position near the main entrance. The Massachusetts Building will be the same one used at St. Louis. It will be taken apart and shipped to Portland, where it will be re-erected.

On the peninsula in the center of the lake will be located the extensive exhibit of the United States government. Here a large government building will be erected. It will be an imposing structure, characteristic of Uncle Sam's exposition buildings, with two towers, each 260 feet high. Besides this main building there will be constructed several minor structures, among them being the Forestry, Fisheries and Irrigation Building and the United States Life-saving Station.

Columbia Court is the central plaza of the exposition and is situated between the Agriculture and Liberal Arts buildings. It consists of two wide avenues, between which are spacious sunken gardens with spouting fountains and beautiful beds of vari-colored flowers. Passing through the court one comes to a parapet at the head of a series of terraces of velvety lawn sloping down to the edge of the lake. Leading down from this parapet to an ornate boat-landing is a flight of broad steps, flanked on each side by massive balustrades. On either side of the stairway are banked beds of blooming roses. Here at night on this entrancing spot with thousands of lights reflected in the still waters of the lake will be given band concerts, pyrotechnic displays and other outdoor features.

The "Trail," which is the amusement street of the exposition, corresponding to the Pike at St. Louis and the Midways of other expositions, has an entirely new environment for this feature of an exposition. It is situated upon a wide bridge which spans the lake and connects the peninsula with the mainland. With the unrivaled water facilities thus offered much attention will be directed to concessions for aquatic features. Many new and attractive shows will grace this bridge, and when the visitor goes up the Trail next summer he will experience many a new sensation.

The exposition will open June 1st and close October 15th and will represent an outlay of approximately $5,000,000. This includes the cost of laying out the grounds and the amounts expended for buildings, exhibits and all other purposes. The largest participant is the government, which has made an appropriation of $475,000. As the government has on hand an exhibit worth more than $300,000, which requires little reinforcement or addition, its action is equivalent to $800,000. Next in rank is the state of Oregon with an appropriation of $450,000, which is at the rate of nearly $1 for every man, woman and child in the state. No state having so small a population as Oregon has ever appropriated so large an amount toward an international exposition. Strange as it may seem, Oregon is better able to give so large a sum than many of the older and richer states for the reason that it has no state debt and is constantly increasing in population and expanding its industries.

FOREIGN EXHIBITS BUILDING AT LEWIS AND CLARK EXPOSITION.

The Exposition company, which was organized and financed by the people of Portland, will expend $420,000, which was raised by the sale of stock.

Other states that have appropriated sums ranging from $10,000 to $35,000 are: California, Montana, Idaho, Utah, Missouri, Washington, Wyoming, Nevada, North Dakota, Minnesota, Arizona, Virginia, New York and Massachusetts. The total state appropriations aggregate $560,000. Besides the above states many others will probably make appropriations when their legislatures meet this winter.

Foreign participation will be extensive, the exhibits being largely drawn from the Louisiana Purchase Exposition, as the countries could not be expected to make a new effort for an exposition following so close upon the St. Louis show. As a result only the cream of what the foreign nations displayed at St. Louis will be transferred to Portland.

Installation of exhibits will begin in January and the present advanced condition of the grounds and buildings insures a completed exposition when the president presses the button on opening day.

GRAND STAIRWAY, LIBERAL ARTS AND FOREIGN EXHIBITS BUILDINGS AT LEWIS AND CLARK EXPOSITION.

Lighting the Exposition.

By James R. Thompson,

Chief Electrician Lewis and Clark Exposition.

Electrical effects not possible in an exposition the size of that which has just closed at St. Louis will be introduced at Portland next summer at the Lewis and Clark Centennial Exposition. In producing these effects a grand total of over 70,000 electric lights will be used and a 4,000-horsepower turbine will be required to supply the current.

The principal lighting scheme of the exposition may be seen by following the major axis of the grounds. This axis starts at the colonnade entrance, passes through the central plaza, called Columbia Court, crosses Guild's Lake, and passes through the center of the main government building on the peninsula.

The colonnade entrance opens onto Pacific Court, which will be illuminated by large pillars of light. The visitor is then in position to look along the Lewis and Clark Boulevard, on which will face the principal buildings, all of which will be brilliantly outlined with frosted eight-candlepower incandescent lamps. Columbia Court, situated on the other side of the Lewis and Clark Boulevard, between the Liberal Arts and Agricultural Buildings, and which contains the sunken gardens, leads the spectators to the Grand Stairway, which, with the Sunken Gardens, will be lighted by large post electroliers having staff pedestals and arms designed to give a spray effect and each containing 27 Meridian lamps.

From the Lake View Terrace at the top of the Grand Stairway the principal view of the illumination will be obtainable. The Grand Stairway, crossed by boulevards, leads to the boat landing, and directly opposite across Guild's Lake, are the government buildings. The principal government structure is flanked by two towers 260 feet in height with the ends extended by half domes, and running from each tower is a peristyle connecting two smaller flanking buildings—the Territorial and Irrigation Buildings—the whole being arranged in a semi-circular plan. As the style of architecture is the Mission renaissance, it is possible for a lighting design to bring out the outline in perfect shape.

Centennial Park, a natural park which occupies several acres to the northwest of the main group of buildings, will be brilliantly illuminated by 7,000 16-candlepower lamps placed in among the shrubbery and trees. Beginning at the far corner of the park—the northwest corner—the Bridge of Nations, 2,000 feet long, connects the mainland with the government peninsula. The near end of the bridge for a distance of 800 feet will be used as the amusement street of the exposition and is called the Trail. Beyond this the Bridge of Nations proper will be illuminated by six-light post electroliers.

The bridge will be constructed in semblance of an arched stone bridge and the arches will be outlined with eight-candlepower lamps. The principal boulevards and the Esplanade, which, beginning at the boat landing at the foot of the Grand Stairway, extends out into the lake a short distance, then turns westward and crosses the Bridge of Nations, will be illuminated by the same style of post electroliers as those used on the bridge.

Advertising Almost Respectable.

In a recent letter to the New York Sun Mr. Tesla spoke, among other features of the New York subway, of the advertising signs that have been criticized. He made this curiously worded statement: "A few more words in relation to the signs. With all due respect to general opinion, I entertain quite a different view on that subject. Advertising is a useful art, which is being lifted continually to a higher plane, and will soon be quite respectable. It should not be hampered, but rather encouraged. I would give the Interborough company every facility for exploiting it, restricting it only in so far as the artistic execution is concerned."

WESTERN ELECTRICIAN

EVERY SATURDAY.

PUBLICATION OFFICES:
510 Marquette Building, - CHICAGO.
TELEPHONE, MAIN 1746.

Eastern Office, 193 Times Building, New York.
Telephone, 3806J Cortlandt.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the **old address** as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own.* THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

REMITTANCES.—All checks, drafts and other remittances should be made payable to the order of the publishers, the **Electrician Publishing Company,** and addressed to the offices of publication, Suite 510, Marquette Building (204 Dearborn Street), Chicago, Illinois, U. S. A.

AS THERE are "diseases of civilization"—entirely modern maladies requiring new remedies—so does the industrial advancement of the body politic seem to bring new complaints in its train. At least, this is the view of some of the shippers by the Great Lakes and the waterways connected therewith. It is again asserted that at some future date the Dominion government will discuss with the Washington authorities the advisability of appointing an international commission to consider the effect upon the level of international waters situated along the boundary of power-development works and hydro-electric enterprises. There are said to be at least three instances where Canada has cause of complaint on this score by reason of works constructed on the United States side of the line. One of these is on the St. John River in New Brunswick, the second is at Sault Ste. Marie, Mich., and the third is in the state of Minnesota. With respect to the last-named, a memorial will shortly be forwarded to Washington, it is said. The construction of the Chicago Drainage Canal is also mentioned as a possible cause of complaint, but this can hardly be taken seriously, as the lowering of the lake level thereby must have been very slight. The same observation applies to the other cases also, no doubt, and it is unlikely that any serious results are to be apprehended from the amount of water so far diverted. But it is conceivable that waterpower developments might be carried far enough to affect navigation unfavorably, and it is not strange that the possibility is attracting attention.

IN THE employment of static electricity in electrotherapeutics it is to be observed, as noted by a recent writer, that the current strength of the static discharges is remarkably small. In fact, it is probably the minuteness of the quantity that permits the employment of the static currents for the production of muscular contractions and other characteristic effects. The diffusion of the static current of such very small amperage produces mechanical effects with a minimum of ionic interchange. It is this fact which eliminates all possibility of danger; for currents of large quantity and possessing power of great diffusion when passed through the tissues of the body are apt to produce electrolytic effects, and are destructive to cell life. With the static currents, the current flow is ample from a Holtz machine having eight revolving plates, 30 inches in diameter, to meet most therapeutic demands, the greater capacity of more powerful machines often producing unpleasant effects. But used with good judgment, static electricity is thought by not a few conservative practitioners to have a large field of employment in medicine, particularly in the treatment of errors of metabolism, local or general.

A FOUR-TRACK railroad for steam operation even is still considered worth talking about; indeed, we believe that there is but one steam road in the country now operating for any considerable distance as a four-track road. Therefore, a four-track electric railway, even if short by trunk-line standards, is worthy of attention. The entire main line of the Chicago and Milwaukee electric railway, now in operation, will within a short time be equipped with four tracks, with very slight grades and with a roadbed approaching in construction modern steam-railroad practice. Work has already been begun on the four-tracking of the line and at the same time extensions are being pushed northward, the goal in view being Milwaukee. When this city is reached and negotiations are concluded by which the line may gain admission to Chicago, one of the finest interurban electric lines in the country will be completed. It will thus connect Chicago with the metropolis of Wisconsin, passing through many thriving small cities en route. Rapid transportation will be offered to suburban residents near the larger cities, and with four tracks on the major part of the system an extensive freight business may be built up without disturbing the passenger traffic. The leading article in this issue is devoted to a description of the Chicago and Milwaukee electric railway and will be especially interesting from the fact that it relates to the first four-track electric interurban line in the United States.

PRESIDENT ROOSEVELT'S message to Congress, while unusually interesting and important, does not contain many references of specific significance to electrical men as such. We may, however, direct the attention of electric-railway managers to that portion of the document relating to safety in railroad travel. Electric railways are steadily encroaching on the field hitherto occupied by steam railroads, and in rising to enlarged opportunities they must accept increased responsibilities in methods of construction and operation. Thus what the president says on this subject deserves the careful attention of those responsible for the operation of interurban railways. Following is a condensation:

The ever-increasing casualty list upon our railroads is a matter of grave public concern and urgently calls for action by the Congress. Many of our leading roads have been foremost in the adoption of the most approved safeguards for the protection of travelers and employes, yet the list of clearly avoidable accidents continues unduly large. The passage of a law requiring the adoption of a block-signal system has been proposed to the Congress. I earnestly concur in that recommendation and would also point out to the Congress the urgent need of legislation limiting the hours of labor for railroad employes in train service upon railroads engaged in interstate commerce and providing that only trained and experienced persons be employed in positions of responsibility connected with the operation of trains. The law of 1901, requiring interstate railroads to make monthly reports of all accidents to passengers and employes on duty, should also be amended so as to empower the government to make a personal investigation, through proper officers, of all accidents involving loss of life which seem to require investigation, with a requirement that the results of such investigation be made public. The safety appliance law, as amended by the act of March 2, 1903, has proved beneficial to railway employes, and in order that its provisions may be properly carried out the force of inspectors provided for by appropriations should be largely increased.

It is of course likely that Mr. Roosevelt had the steam railroads, with their shocking list of accidents, in mind when he made these recommendations. But we cannot forget that only two years ago the president himself was hurt, with a narrow escape from more serious injury, perhaps death, by the collision of an electric car with his carriage in Pittsfield, Mass. Efficient brakes and the best of signaling apparatus are none too good for electric interurban railways. The electric system is introduced as an economic and physical improvement over the steam locomotive. Let it also bring with it a cleaner record of safety in travel.

Four other features in the message may be referred to very briefly. The first is the president's proposals for the irrigation of arid lands in the West. In discussing this work he says, among other things:

During the 2½ years that have elapsed since the passage of the reclamation act rapid progress has been made in the surveys and examinations of the opportunities for reclamation in the 13 states and three territories of the arid West. Construction has already been begun on the largest and most important of the irrigation works, and plans are being completed for works which will utilize the funds now available. The operations are being carried on by the reclamation service, a corps of engineers selected through competitive civil-service examinations. This corps includes experienced consulting and constructing engineers, as well as various experts in mechanical and legal matters, and is composed largely of men who have spent most of their lives in practical affairs connected with irrigation.

As we have previously pointed out, there are power-transmission possibilities in connection with the proposed irrigation reservoirs which should be carefully watched.

The president believes that it is wise to build submarine torpedo boats. All naval authorities do not agree with him, but the building of submarines makes some slight addition to the demand for batteries and motors, which is one good result at any rate.

In relation to coast fortifications the chief executive advises that "We should, however, pay much more heed than at present to the development of an extensive system of floating mines for use in all our more important harbors. These mines have been proved to be a most formidable safeguard against hostile fleets." Explosive mines are certainly a most useful means of harbor defense. They are electrically operated in nearly all cases, and experience during and just prior to the Spanish-American war shows how vital it is that adequate preparation should be made in times of peace. The president's warning should be heeded. Not a few electrical men could give valuable assistance in this work should the government require their services.

It is pleasing to observe a word of recognition of the work of the Signal Corps in laying cables and building telegraph lines in Alaska. "This work has been done in the most economical and efficient way," says Mr. Roosevelt.

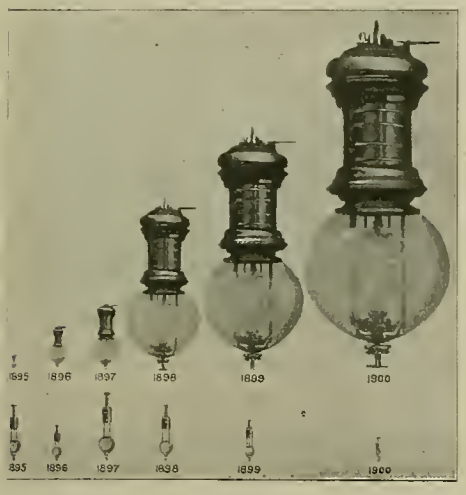
In its entirety the message is an unusually important contribution to state literature. A few scattered extracts give but a scant idea of its vigor and originality. The president has added to his reputation as an author as well as a statesman by this production.

Arc Lighting Here and Abroad.[1]

By Francis B. Badt.

In comparing arc lighting in the United States and abroad one is struck with the great development of the enclosed lamps in the United States, whereas abroad the open arc lamp still holds sway. The reasons, of course, for this peculiar condition have been discussed many a time, and are mainly to be sought in the relationship between the prices of labor and of carbons on one hand, and the cost of producing the current on the other hand. Labor for lamp trimming and carbons being comparatively expensive in the United States, a long-burning arc lamp requiring less labor is preferable here, in spite of the lower candlepower for a given voltage of the enclosed arc.

The accompanying illustration is reproduced from the General Electric Company's bulletin of February 25, 1902, showing a comparison of the sales of enclosed and open arc lamps from 1895 to 1900, which best illustrates the ascendance of the enclosed-arc lamp and the decline of the open-arc lamp in this



COMPARISON OF SALES OF ENCLOSED AND OPEN ARC LAMPS.

country. No exact statistics have been available since the publication of the bulletin referred to, but, from reliable estimates and general observation, it is fair to assume that the sale of enclosed-arc lamps has increased in geometrical progression and that the sale of open-arc lamps has decreased correspondingly.

There is also quite a difference in the systems on which arc lamps are operated in this country and abroad. We confine ourselves to showing the different lamps and systems used in this country. (See Table I.) Table II. gives the so-called nominal candlepower, the amperes and volts at the arc; also the sizes of carbons. The term "nominal candlepower" is fortunately going out of use, and arc lamps are now usually rated by amperes and volts consumed at the arc.

All these, of course, are only average figures, derived from many makes and systems in vogue

Table I A.

ARC LAMPS.

Alternating Current.
High-voltage Constant-potential System.)

- Constant-current transformer for circuits up to 10,000 volts.
  - Enclosed arc lamps in series allowing 78 volts on 60-cycle and 83 volts on 125-cycle current for each lamp. Line drop not included.
- Constant-potential transformer for incandescent-lamp circuit 110 volts.
  - Open lamps
    - Three lamps in series.
    - One lamp on individual transformer stepping down from 110 volts to 35 volts.
  - Enclosed lamps.
    - One lamp in multiple.

A. C. Enclosed. Nominal: 2,000 c. p....	6-7.5	70-80	9½x½ in. cored or vice-versa	6½x½ in. solid	

here. The lengths of the carbons selected in this table are supposed to give, under proper conditions, a life of about 12 hours in the open lamp, and of about 125 hours in the enclosed lamp. The diameter of the carbon given in the table is such as is most commonly used; for greater candlepower efficiency carbons of smaller diameter might be used to advantage, although the life of the carbons, of course, would be reduced. From recent experiments, it seems that the raising of the current density increases not only the mean spherical candlepower, but also improves the quality of the light and the steadiness of the arc.

English Impression of American Electrical Engineering.

In concluding a serial article on "The Visit of the Institution of Electrical Engineers to America" a writer in the Electrical Review of London gives the following impression of electrical-engineering practice in the United States:

A feature of all the newer power stations was the almost complete control of the plant from the switchboard, which in itself was of the diagram type, having mounted on it only the instruments and small control switches or presses which controlled the main electrically operated switches. The highest alternating-current pressure on the switchboard panels did not often exceed 115 volts, derived from potential transformers. The field rheostats, the main engine governors, the main and feeder switches, the main steam stop valves, etc., were generally motor operated, usually being placed out of sight of the switch gallery, tell-tale colored lamps and indicators informing the switchboard attendant as to whether they were open or closed. Batteries seem to be very little used, probably due to the very large size of the average power station, where there would be no capital saving by their introduction. It is generally admitted, though, that they would be advantageous in sub-stations.

All the power and light distribution outside the actual business centers of the cities is carried out by the aid of overhead cables. Transformers are mounted on the top of the posts at points where energy is required for local use. This overhead construction is very unsightly and little care seems to be exercised in choosing straight poles, which does not add to the neatness.

The construction of the streets was deemed very poor and the tramway tracks were decidedly bad. The overhead construction was often of a very flimsy character. It was not at all unusual to see a feeder being used as a span wire and thus serving a double duty. The use of wooden posts undoubtedly does away with the necessity of having good insulators, which is an economy. One trolley line used on constructional work at Niagara Falls was attached to the wooden cross-arms of the posts by the simple method of twisting a piece of wire around both, the only insulation being that due to the post itself. This, of course, was an extreme case.

The high speed at which the trolley cars are operated must be seen to be appreciated; 30 miles an hour is often attained in the cities and 40 to 70 in the country. The almost universal adoption of air-brakes, however, means that the cars are well under control. It would seem that the introduction of air-brakes into England would be of great advantage, more especially on the heavier cars, for it is a successful power brake that is entirely independent of the car motors. The use of such a brake also ensures that the brake-blocks are not kept in a position where they just rub on the wheels, as is so often done by drivers in England, when using a hand-brake, so as to enable them quickly to apply the brake when necessary, regardless of the power they are wasting.

The curves on the double track, when turning a street corner, were nearly always too close to each other, with the result that two cars could not pass each other without colliding. The straight-running trolley head is in use almost without exception.

Horse and cable-drawn cars are still in use for special reasons in New York and Chicago, and many of the tramway concerns are in a far from flourishing condition, the dividends, if any, being very low.

To English minds the railway level crossings seemed very unprotected and dangerous.

The practice throughout the country seems to be to let each man look out for danger for himself, there, apparently, being no grandmotherly, or otherwise, Board of Trade to look after him.

The single-phase railway problem is one that is absorbing a great deal of attention at present, and good results are being obtained; already one commercial road is equipped and another is in course of equipment.

It was very noticeable how complete a control of the electrical business the two large electrical manufacturing concerns in the United States have, other firms not seeming to have the opportunities they would get in England for introducing their manufactures.

Disappointment was expressed at many of the machine shops, for though there are some very fine shops in America, there are also others which could learn many lessons from England. Perhaps the most striking feature was the radical change in practice that has been brought about by the use of high-speed steel. No process discovered in recent years has effected such an increase of manufacturing capacity and such a general revolution in machine design. Incidentally it has caused a temporary difficulty in setting piecework prices.

It was very striking to note how comparatively young the leaders in American engineering enterprises are; most of them have made their names before leaving the thirties behind, and are consequently men with a long future before them.

The courtesy of the Americans to the visitors was very open-handed and generous, nothing being too much trouble for them to undertake in the way of entertainment or instruction. This was much appreciated by the visiting party, as it enabled them to see much in a short time with a minimum of fatigue, and all carried away with them a very pleasant recollection of American energy, enterprise and hospitality, as evidenced by the electrical-engineering section of the community.

Mysterious "Wireless" in the North Sea.

A Russian naval officer, in a semi-official account of the famous North Sea incident by which English fishing boats were fired on by the Russian squadron, mentions in an interesting manner the extent to which space telegraphy is alleged to have figured in the affair. Following is an extract from his story:

"The following day, the 8th [21st] October, at eight o'clock in the evening, when it was already quite dark, we received by wireless telegraph the information that behind us at a distance of 30 miles was the transport Kamchatka, which, owing to some trouble with its machines, had fallen behind the detachment (the cruisers Dmitri Donskoi and Aurora), and that it was being followed by several torpedo boats, which were not, however, attacking.

"The order was at once given by wireless to Admiral Enkwist, who was ahead with the two cruisers Donskoi and Aurora, to slow down and await the Kamchatka or to steam ahead and not show themselves to the torpedo boats, which, of course, were also reading our telegrams, but did not know whence they came.

"But the Japanese all the same made an attempt to find out our whereabouts. While we were exchanging messages with the Kamchatka we suddenly began to receive a series of telegrams:

"'Where is the squadron?' 'Indicate your width and length,' 'Which place is the Suvoroff in?' All in pure Russian and with the signature 'Kamchatka.'

"These telegrams appeared suspicious to us, and to make sure that it was really the Kamchatka who was sending them, instead of replying we ordered them to give us the Christian name and patronymic of one of the officers of the Kamchatka.

"This was received with complete silence, the questions ceased, but the conversation with the Kamchatka continued regarding the cause of her falling back, etc., but in cipher, so that the Japanese were unable to understand anything.

"It was evident that the questions which were telegraphed were made by Japanese taking advantage of our telegraphing the Kamchatka and that they wanted to find out where we were, that is the battleships, which they were trying to get at."

Table I B.

ARC LAMPS.
Direct (continuous) current.

- Series Arc Constant-current System.
  - Open lamps.
  - Enclosed lamps
- Multiple or Multiple-series Coostant-potential System.
  - Open lamps.
    - 110-volt circuit two lamps in series.
    - 220-volt circuit four lamps in series.
    - 550-volt circuit 10 lamps in series.
  - Enclosed lamps.
    - 110-volt circuit.
      - One 110-volt lamp in multiple.
    - 220-volt circuit.
      - One 220-volt lamp in multiple or two 110-volt lamps in series.
    - 550-volt circuit
      - Two 220-volt lamps in series or five 110-volt lamps in series

1. From advance sheets of a forthcoming revised edition of the Dynamo Tenders' Handbook.

Ohio Telephone Notes.

The meeting of the Ohio Independent Telephone Association will be held in Columbus some time in March, according to arrangements made a few days ago by the executive committee which met in Columbus. In the meantime district meetings will be held through the winter and delegates will be chosen. The state meeting will be devoted to a general discussion of the subjects that will be decided upon later, several papers forming the basis for the talks. James B. Hoge, Ed. L. Barber, Frank L. Beam, Cyrus Huling and Dwight Sapp were present at the Columbus meeting.

Arguments have been made in the case of the Queen City Telephone Company in the Circuit Court at Cincinnati. It will be remembered that the Common Pleas Court reversed the decision of the Probate Court in granting the telephone company the right to operate in Cincinnati and the case was taken up on appeal.

The motion of Sol. P. Kineon and George G. Kineon of Cincinnati to remove their case from the Circuit Court at Covington to the Federal Court has been granted. The Kineons had been restrained from bulding telephone lines through Covington. It is alleged that they built a line after a restraining order had been issued against them and an order of contempt was entered against them. There was then a question as to whether their case could be removed to the Federal Court as long as this charge was hanging over them.

The Montgomery County Telephone Company will in a short time be in position to begin operations extensively in building lines to connect all the post-offices of the county. In addition the complete network of lines will furnish service to all farmers who desire it. The people who are interested in the Dayton Home Telephone Company are also the leading stockholders of the new company. The capital stock is $100,000 and most of it has been sold. Columbus men have purchased quite a block of it. J. C. Reber and Manager Miller of the Dayton Home are the active promoters of the country system. This plan of building country lines in close connection with some plant in a larger city will without doubt result in the very thorough development of Ohio. Frank L. Beam was the first to test the plan and has found that it pays in Franklin County.

A large new switchboard is being installed in the exchange of the Columbiana County Telephone Company which will give it the facilities it has needed for some time. It is believed now that its business will develop rapidly and the officials are well pleased with the outlook. The company has succeeded in getting the new rates firmly established and they will be adequate to the increased service that will now be given.

It is said that the United States Telephone Company will sell $2,000,000 bonds within the next year and a portion at least of the proceeds will be used for extensions and betterments. A pool will probably be formed and the bonds held at 85 or better. They are now in active demand in the Cleveland market at 70. The lines of this company will soon reach all the exchanges in the state and be connected with the other long-distance lines. About $225,000 has been spent the last year in these extensions and the same amount will be put out for the same purpose the coming year. When all the new lines are in operation the business will without doubt show a large increase. C.

Telephone News from the Northwest.

The Hudson (Wis.) Prairie Telephone Company has been incorporated by E. W. Helms and others.

The Sioux City Telephone Company has started pulling the cables through its new conduits, which were laid this summer.

C. A. Walker of Brainerd, Minn., the owner of the local telephone line, proposes a long-distance line to Walker, Minn.

The Cyrus (Minn.) Mutual Telephone Company has been organized.

The Lismore (Minn.) Telephone Company has been formed to build a rural system.

The Tri-state Telephone Company has opened an office at Benson, Minn.

It is reported that the Minnesota Central Telephone Company will meet the competition of local merchants at Springfield, Minn., who are backing a new telephone company there, by opening a general store and meat market. This is in addition to having cut telephone rentals deeply as a matter of competition with the new home company.

The Duluth Telephone Company has about completed some extensive improvements to its local exchange at Cloquet, Minn.

The Madelia Telephone Company of Madelia, Minn., has declared a dividend of six per cent., the second in the 12 months which the company has been running.

The Mille Lacs Lake Telephone Company has completed its line from Aitkin, Minn., to Cove.

The Central Dakota Telephone Company has completed its line to Geddes, S. D., and has put in an exchange there and at Platte.

The Wood Lake (Minn.) Rural Telephone Company has filed articles of incorporation with $30,000 capital. G. A. Boettcher heads the list of stockholders.

The Flandreau (S. D.) Telephone Company has sold its system to George W. Hart of Egan, who owns the lines in and about the latter place. The two systems will be connected.

Noxon & Oglesby have sold the telephone exchange at New Rockford, N. D., to Henry Wilson.

A stock company will be formed to assume the business of the Home Telephone exchange at Grand Meadow, Minn.

The Belmont (Wis.) and Pleasant View Telephone Company has been incorporated with a capital stock of $5,000. F. T. Hinkins is president and John Hillory, secretary.

The Cyrus (Minn.) Mutual Telephone Company has purchased the exchange at Glenwood, Minn.

The Clanton Valley Farmers' Telephone Company has been incorporated at St. Mary, Iowa. O. Springer is president and T. G. Sever secretary.

The Michigan State Telephone Company's system at Sault Ste. Marie, Mich., will be remodeled.

The Jansen (Neb.) Telephone Company has been incorporated with $10,000 capital. J. E. Grebe heads the list of incorporators.

The Alta Telephone Company has been granted a franchise at Alta, Iowa.

The Western Electric Company has secured an injunction, it is said, against the Midland Telephone Company restraining its using the new line into Spirit Lake, Iowa.

The Rockwell Telephone Company is putting in a line from Rockwell, Iowa, to Thornton. R.

Indiana Telephone Items.

The Disko and Laketon Telephone Company filed articles of incorporation on December 1st. This company has a capital of $15,000, and proposes to establish and operate telephone lines in Wabash, Fulton, Miami and Kosciusko counties, with the principal office and exchange in Laketon. Frank K. Zimmerman, E. L. Harmon, H. C. John and others are the incorporators.

An open meeting of the City Council of Evansville was held last week to consider the telephone-franchise question, and the meeting was largely attended. The proposition of the Cumberland Telephone Company to pay the city $2,250 a year for 45 years for a franchise of even years was vigorously opposed by the citizens present. The people of Evansville are insisting that no franchise be granted to any company until after the decision of the federal court is handed down in the case now pending; and that when a franchise is granted the price of resident telephones be fixed at $1 a month and that the company be compelled to make connection with Independent companies.

The interurban telephone system on the Indianapolis, Greenwood and Columbus line came promptly to the assistance of the Pennsylvania Railroad company on December 2d. A collision occurred on the steam line, killing four men and injuring many others. The accident occurred seven miles east of Columbus, and in view of an interurban car on a parallel line. The motorman ran to the nearest telephone post and telephoned Mr. Irwin at Columbus, who brought physicians and citizens to the scene of the wreck on an interurban car.

The Central Union Telephone Company has made the announcement that if it wins its suit in the Appellate Court it will rebuild its plant in Wabash and regain what was lost through aggressiveness on the part of the Home Telephone Company.

The Merchants' Mutual Telephone Company of Michigan City is installing a new switchboard. The officials say the company's unusual increase in business necessitated the new improvement. The company is preparing to extend its lines early in the spring.

A new telephone exchange has been established in Liberty. This is the outgrowth of the merging of the College Point and Brownsville telephone companies.

A new line is being constructed between Rochester and Kewanna by the Rochester Telephone Company.

The South Bend Home Telephone Company claims to have had a very prosperous year. The company installed nearly 57,000 feet of aerial copper wire and about 20,000 feet of underground cable. The system is extended to the scattered suburbs of the city and has connection with surrounding towns and cities. The officials are preparing for an elaborate opening of their improved plant on December 31st. The public will be invited to make an inspection of the modern plant.

The Indiana School of Telegraphy has been incorporated with headquarters in Goshen. The capital stock is $10,000. C. S. Rhodes, superintendent of telegraphers of the Big Four railroad, and J. E. Nusbaum are the principal managers and stockholders. S.

The Utah Independent Telephone Company of Salt Lake City recently opened its new exchange at Ogden. The event was made the occasion of a reception which was attended by the directors of the company and a large number of friends, including Governor Wells. Service between Salt Lake City and Ogden was established with the local system. The Ogden and Salt Lake systems are identical except for size. The new exchange started with 900 subscribers and 25 operators.

Next Week's Meeting of the Interstate Independent Telephone Association of America.

The annual convention of the Interstate Independent Telephone Association of America will be held at the Auditorium Hotel, Chicago, next week, the dates being December 13th, 14th and 15th. The social feature announced on the programme consists of a banquet, concert and vaudeville performance. Reduced rates on railroads have been secured, it is said, and Secretary E. M. Coleman of Louisville, Ky., requests those who contemplate attending the meeting to notify him.

Following is the programme:

TUESDAY MORNING, 9 TO 12 O'CLOCK.

Reception of members and friends by the executive committee at the secretary's office.

TUESDAY AFTERNOON, 2 TO 5 O'CLOCK.

President's annual address.—Henry A. Barnhart, Rochester, Ind.

Report of the secretary.—E. M. Coleman, Louisville, Ky.

Express committee.—G. N. Bandy, chairman, Des Moines, Iowa.

Freight rates committee.—Theodore Gary, chairman, Macon, Mo.

Railroads committee.—F. W. Buffom, chairman, Louisiana, Mo.

Committee on Postmaster-general Payne's order.—L. L. C. Brooks, chairman, Minneapolis, Minn.

Committee on uniformity of equipment and standardization of apparatus.—C. E. Hull, chairman, Salem, Ill.

WEDNESDAY FORENOON, 9 TO 12 O'CLOCK.

Officers and executive board will take charge of delegates visiting exhibits.

WEDNESDAY AFTERNOON, 2 TO 5 O'CLOCK.

"Why Independent Telephone Securities do not Command the Market Price They Deserve According to Their Earning Capacity," O. M. Bake, Hamilton, Ohio.

"What the Independent Telephone Companies Owe the Public. What the Public Owes the Independent Telephone Companies," Theodore Thorward, president Indiana Independent Telephone Association, South Bend, Ind.

"Manufacturers' Duties and their Dues," E. D. Graham, president Mexico Telephone Company, Mexico, Mo.

"Uniformity of Equipment and Standardization of Apparatus the Imperative Demand in the Operating Field," J. H. James, president Minnesota Independent Telephone Association, Mankato, Minn.

THURSDAY MORNING, 9 TO 12 O'CLOCK.

"The Importance of Bringing About, by Legislation or Otherwise, Uniform Telephone Rates for Exchange Service in Towns of the Same Size; also Uniform Toll Rates," E. H. Moulton, president Twin City Telephone Company, Minneapolis, Minn.

"How to Avoid Personal Injury and Responsibility in Telephone Construction Work and Maintenance," R. C. Stephenson, Rochester, Ind.

"Who Are We? How Did We Get There? What of the Future?" A. C. Davis, manager Parkersburg Telephone Company, Parkersburg, W. Va.

"The Evils of Connecting with the Bell," P. C. Holdoegle, Rockwell City, Iowa.

THURSDAY AFTERNOON, 2 O'CLOCK.

Officers and executive committee will take charge of and entertain the delegates, visiting exhibits, etc.

THURSDAY EVENING.

Banquet, concert and vaudeville.

Secretary Coleman is making an energetic campaign by correspondence with exchange managers to promote the success of the convention. One interesting feature is the providing of a credentials certificate to be filled out by the secretary of the telephone company sending delegates. The object of this is "to prevent spies and Bell emissaries from being present at business sessions."

NEW COMPANIES.

The Inter-county Telephone Company has been incorporated with $2,000 capital and will construct a telephone system at Huntsville, Ala.

The Home Telephone Company of Clarksville, Texas, has been incorporated. The capital is $2,500. J. B. King, N. P. Doak and Hiram Glass are interested.

The Rural Telephone Company of Belleville, Ill., has been incorporated with a capital of $2,500. Albert Hucke, L. D. Turner and G. W. Dethardin are interested.

Everett H. Snedeker and several Brooklyn business men have incorporated the Long Island Telegraph and Telephone Company, with a nominal capital of $5,000. The sphere of operation will be in the counties of New York, Kings, Queens, Nassau and Suffolk.

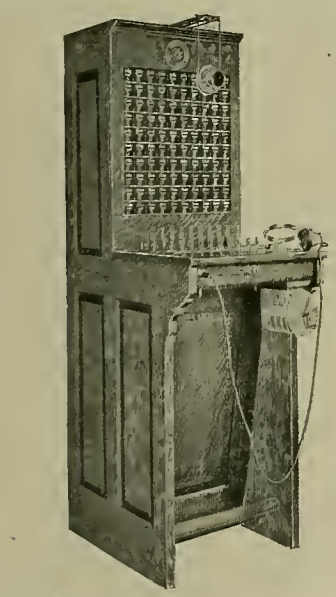
Underground Construction for Small Telephone Exchange.

As a general rule, the average telephone manager has formed the idea that underground construction is altogether too expensive and complicated to be considered for a small exchange. This, however, is probably due to the old habit of doing as "the other company did," which was to use the overhead construction with poles, brackets, cross-arms, insulators, etc. Many new companies of small or medium size that are just starting to put in exchanges are now using the underground system altogether, and they consider that they are "ahead of the game," financially, with a construction that does not use up their profits and energy to maintain.

There are many different methods by which the underground work may be constructed. The main point is to cover the cable or cables with some kind of hard outside covering that will protect them from being damaged either by workmen making other excavations or by acids, gas, etc. At certain intervals the cables run into junction boxes, from which the wires are distributed to the different telephones, or where it may be necessary to make a splice. These junction boxes must be absolutely waterproof and carefully sealed up, as it would damage the entire cable if water could get into them.

UNDERGROUND TELEPHONE CONSTRUCTION WORK IN WAYNE, NEB.

Perhaps the best and most expensive conduit for covering underground cable is cement tubing. This, however, is principally used in large cities, where it is necessary to use many cables. Several other types of conduit are also used with success. Common ordinary gas pipe is frequently employed. Even ordinary angle iron put on top of the cable with sharp corner up may be used in some cases. The simplest way, which should only be used under very favorable circumstances, is to use the cable with its lead covering only. In this case the ditch should be dug in shape of a V and about six inches of dry sand put in at the bottom before the cable is placed in it. On the top of the cable there should be another six-inch layer of sand, and then finally a layer of ordinary brick, after which the ditch is filled up.



TELEPHONE SWITCHBOARD USED IN WAYNE, NEB.

An exchange that has successfully accomplished its underground construction, and which is now enjoying the results, is that of the Wayne Independent Telephone Company of Wayne, Neb. This plant started operations May 1, 1904, with 75 subscribers. It has now about 200, of whom 75 are farmers in the country. The business part of the town has an underground cable 1,200 feet long, with capacity of 250 metallic lines, the "fiber conduit" being used exclusively. The remainder is overhead construction and metallic all through. The views that are here shown illustrate how the work was done.

The inside equipment consists of a 200-line switchboard made by the Swedish-American Telephone Company of Chicago. The instruments are of the same make. One day and one night operator are constantly employed. The cost of maintenance has been reduced to practically nothing, owing to the excellent construction and equipment. When the number of subscribers has reached 300, which is expected to be soon, the monthly rates are to be $2 for business and $1.50 for residence instruments. Farm lines are rapidly coming in, and the company expects to have at least 500 subscribers within the next six months. Toll-line connections will soon be established with Lincoln and Omaha. The company is already giving toll service to all the small towns of the country. Wayne is the county seat of Wayne County and has a population of 3,500. The affairs of the company are in the hands of Mr. F. M. Ferguson, president, and Mr. A. N. Matheny, manager. These gentlemen believe that underground construction for small telephone exchanges is a money-saving enterprise which is bound to be used extensively whenever the exchange managers become familiar with its merits.

Bell Ownership in Subsidiary Companies.

The following table is part of one published by the Boston Financial News and is interesting as showing that paper's estimate of the amount of stock of the subsidiary companies owned by the American Telephone and Telegraph Company:

Name of Company.	Div. Rate.	Total Stock	Owned by A. T. & T Co.
Bell Co. of Buffalo.....	6	$ 5,500,000	$ 2,762,650
Bell Co. of Can.....	8	8,000,000	4,800,000
Bell Co. of Mo.....	8	2,639,100	1,752,000
Bell Co. of Pa.....	8	11,976,600	9,688,140
Cen. Dist. Tel & Printing Co. of Pitts.	8	9,206,940	6,191,920
Cen. N. J. T. & T. Co....	1	961,500	527,500
Cen. Un. Tel. Co..... ..		5,450,927	4,175,952
Ches. & Potom.	2	2,650,000	1,512,100
Chic. Tel. Co.	6	12,553,145	6,760,000
Cin. Tel. Co.	6	3,564,850	1,091,450
Colo. Tel. Co.	6	3,400,000	1,744,250
Cumberland Tel. Co.	6	11,018,540	5,178,000
Del. & Atlan.		397,945	150,667
Duluth Tel. Co.		100,000	56,660
Empire State Tel. Co.		200,000	131,886
Hud. River Tel. Co.	6	4,000,000	2,028,000
Iowa Tel. Co.		1,600,000	648,345
Mo. & Kan. Tel. Co.....	6	3,327,000	1,747,400
Nebraska Tel. Co.	6	1,870,300	1,122,616
N. E. T. & T. Co.....	6	*21,616,000	12,587,500
N. Y. & N. J. Tel. Co....	7	11,995,050	6,117,475
N. Y. & Pa. Tel. Co..... ..		1,000,000	492,900
N. Y. Tel. Co.....	6	33,750,000	21,475,581
Pac. States T. & T. Co...	6	12,000,000	6,021,300
Pa. Tel. Co.	6	2,210,000	1,325,000
Prov. Tel. Co.	8	1,600,000	480,000
Rocky Mt. Tel. Co.....	6	2,097,500	1,021,100
South. Bell Co..... ..		1,000,000	980,500
So. N. E. Tel. Co.....	6	2,990,000	995,400
West. T. & T. Co.....	5	32,000,000	21,440,000

*Does not include recent issue of stock, last instalment payable in February, 1905.

The People's Union Telephone Company has been granted permission to construct a telephone system at Stuttgart, Ark.

Indianapolis Telephone Company to Build

The Indianapolis Telephone Company reports the most successful year in its history. President Sheerin says that since last January it has added 1,856 new subscribers in the city and Marion County. To accommodate these it was necessary to increase the cable and switchboard facilities 25 per cent. The company is now much cramped for office room, and in the early spring will break ground for a new building on its present site in North Meridian Street opposite the Federal Building. The plans, which are now being prepared, contemplate the ultimate erection of a fireproof structure eight stories high, to cover the entire ground, 50 by 195 feet. The part to be erected next year, however, will only be 50 by 100 feet, four stories high, and will be situated on the rear half of the lot. A large amount of new equipment will be placed in this new building next year, and later on the present old building will be replaced by the other half of the new building.

The New Long-distance Telephone Company also gives a favorable report, not only of its own business, but of the business of its connecting exchanges throughout the state. Mr. Sheerin says that a recent computation made up from the returns for taxation, which require telephone companies to give the number of telephones and exchange directories all over the state, shows that Indiana now has 166,000 Independent telephones. Eighty-four thousand of these are within a radius of 50 miles of Indianapolis.

Government Departments and Space Telegraphy.

In his eighth annual report, the secretary of agriculture says that his department, through the Weather Bureau, was one of the first of the executive departments to take up, systematically, experimentation in problems concerned with the development of space telegraphy. By this action research into the physical problems concerned in transmitting messages through the medium of ether waves was greatly stimulated in this country. Probably one of the best, if not the best, instruments anywhere made for the receiving of wireless messages had its inception in the experimental work of the Weather Bureau. Recently a board was appointed by President Roosevelt to consider the whole problem of space telegraphy and the relation of the government thereto. Its recommendations, which the president approved, will result in the discontinuance of experiments along this line by the Weather Bureau, their transfer to the Navy Department, and the transfer to the Weather Bureau of the meteorological work now being done by the Navy Department.

GENERAL TELEPHONE NEWS.

The Delaware and Atlantic Telegraph and Telephone Company has increased its capital from $100,000 to $400,000.

C. M. Mitchell has sold his telephone exchange in Italy, Texas, to the Southwestern Telephone and Telegraph Company.

R. P. Bonathan of Butte, Mont., who recently purchased the Havre (Mont.) telephone system, will build a line from that city to Chinook.

The Public Utilities Company which has been organized at Carlsbad, N. M., will immediately construct a telephone line between that city and Artesia, N. M.

The city of Lander, Wyo., has granted a franchise for a telephone line which is to be built from Rock Springs. The line will also probably be extended to nearby points.

The Rocky Mountain Bell Telephone Company will construct several rural telephone lines about Missoula, Mont. The total cost will be about $50,000. The company has sued the city of Red Lodge, Mont., to compel it to admit the plaintiff's lines into that city.

A banquet was recently held in Paris in the Palais d'Orsay by the Association of Telephone Subscribers, who term themselves telephone "victims." During the course of the after-dinner speeches Jules Roche, former minister of commerce, said the telephone service of the United States should be taken as a model.

Frank I. Bills, who has been instrumental, it is said, in organizing more than 100 Independent telephone companies in the West, is just now completing new systems in Lincoln, Neb., and Sioux City, Iowa. Mr. Bills has recently been in Denver, Colorado Springs and other Colorado cities where the Independent movement has been agitated.

It is stated that George F. McCulloch of Indianapolis has abandoned effort for a right-of-way through Hammond, Ind., for his projected Chicago-Indianapolis electric road. The council there gave him a franchise two years ago on condition that he have the line in operation by January 1, 1905. He recently asked for more time, but citizens protested at allowing any line to enter the street, and the promoter, it is said, will seek rights for a route through East Chicago, Ind.

Small Automatic-starting Induction Motor.

Fig. 1 of the accompanying cuts shows a new type of induction motor made by the Emerson Electric Manufacturing Company of St. Louis. The sizes range from one-fortieth to one-sixth horsepower, on 60-cycle current, with speeds of from 1,800 to 1,150 revolutions per minute. The motors occupy considerably less space in proportion to horsepower developed than in any heretofore marketed by this company, and are designed for use where space is limited and ordinary types cannot be employed. While they have less radiating surface, they are guaranteed to carry full rated loads without injurious heating. They operate at a constant speed, which cannot be regulated or changed. The speed of these motors is dependent on the number of field poles in the winding and the frequency of the current, i. e., a four-pole motor (such as shown in Fig. 1) will operate on 7,200 alternations (60 cycles) at a speed closely approaching 1,800 revolutions per minute. The motors are not designed to start under any great proportion of full rated load.

Fig. 1. General View Showing Binding-post Block.

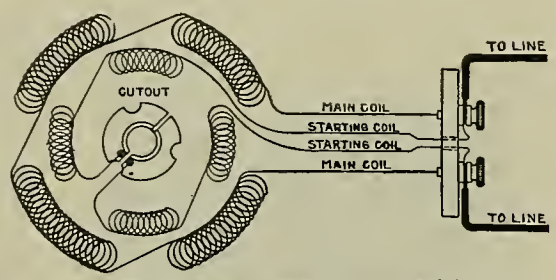


Fig. 2. Diagram of Internal Automatic Switch.

SMALL AUTOMATIC-STARTING INDUCTION MOTOR.

These motors are built with a patented divided-pole form of field winding, comprising an equal number of main and auxiliary or phase coils. The auxiliary field coils (starting coils) are entirely independent of the main field coils, and are in circuit with the line only when the motor is starting. As shown by the diagram of Fig. 2, they are controlled by an internal automatic switch, or cut-out, which disconnects them after the motor has attained sufficient speed. The armature is of the familiar squirrel-cage type, and has no insulated winding of any kind.

Reference to Fig. 1 will show the form of binding-post block employed. The main field coils are connected in series and the leads are attached to the binding posts inside the motor. The starting coils are connected in series with the automatic cut-out, and these leads are brought out through the binding-post block and connected to the binding posts outside. The motor may be readily reversed by changing these leads to opposite binding posts. The binding-post thumbnuts are covered with insulating material. These motors will operate satisfactorily on current differing by not more than 10 per cent. from the name-plate markings, but variations in frequency as well as in voltage affect the motor, and the total variation in current should not exceed that figure.

Mr. Parsons Leaves the New York Rapid Transit Commission.

William Barclay Parsons, chief engineer of the New York Rapid Transit Commission, has resigned in accordance with plans originally made 12 months ago. It is expected Mr. George S. Rice, deputy chief engineer, will succeed to the position made vacant and that Mr. Parsons will resume his private practice or, it is said, possibly go to superintend work at Panama. Mr. Parsons' resignation was accompanied by a letter to President Orr of the commission in which he expressed regret upon returning to the board the commission entrusted to him. He stated that the work begun by him had been finished and that the new work with its new plans and broad development could well be treated by other hands.

Mr. Parsons was born in New York city in 1859. He was graduated from Columbia College in 1879, and from the School of Mines in 1882. At the outbreak of the Spanish-American war he was made chief engineer, with the rank of brigadier-general, state of New York. In 1898, as chief engineer of the American-Chinese Development Company, he made an exploring tour through Eastern China and afterward wrote a book describing conditions in China. He was called to London a few months ago as an expert before a British royal commission which was trying to relieve traffic congestion in the London streets.

The connection of Mr. Parsons with projects for underground rapid transit in New York began when he was 27 years old. In 1886, 1887 and 1888 he was engineer for the New York District Railway and the City Railway, two proposed underground railroads. In 1891 he was appointed deputy chief engineer of the Rapid Transit Commission and assisted in the preparation of the plans for the Broadway route. In 1894 he was made chief engineer of the present Rapid Transit Commission.

Electrical Trades Association at Dinner.

The Electrical Trades Association of Chicago held its annual meeting at the Grand Pacific Hotel, Chicago, on Friday evening, December 2d. The meeting was the ninth annual one in the history of the association and the special feature was a dinner, the first given by the organization. The Electrical Trades Association of Chicago has a membership of 125 and about 75 were present at the meeting and dinner, including men from Cleveland, Cincinnati, Louisville, Detroit, Milwaukee, St. Louis, Kansas City, Omaha, New Orleans and other cities, as well as Chicago.

President E. R. Gilmore, assistant treasurer of the Western Electric Company, presided. He introduced James Wolff of the New York Insulated Wire Company as toastmaster. Mr. Wolff performed his duties in a graceful and pleasing manner. Mr. Wolff called upon several speakers to respond to the toasts. Thomas I. Stacey of the Electric Appliance Company was the first to respond on "The Association." Frank G. Jones of the American Electric Fuse Company responded to the toast, "The Credit Man," and George Cutter amused the diners by his response to "Our Basket of Eggs." Frederic P. Vose, general counsel for the association, handled his subject, "The Law," in a clear and convincing style. Thomas R. Mercein of Milwaukee and others made short speeches. The gathering was considered the most interesting in the history of the association.

Fireproof Porcelain Sign Letters.

The electric-sign business nowadays appeals strongly to the central-station manager, since it furnishes a load that is practically constant for a certain period of the evening hours. One of the greatest, if not the greatest, essential, in the electric sign is that it be absolutely fireproof. Other points to be considered in selecting an electric sign are attractiveness, durability and economy in operation. The true cost of a sign is found in the sum total of expenditures—the cost of the sign, plus the cost of repairs, plus the cost of operating.

FIG. 1. FIREPROOF PORCELAIN SIGN LETTER.

The accompanying pictures illustrate the fireproof porcelain electric-sign letters manufactured by the Colonial Sign and Insulator Company of Akron, Ohio. These porcelain letters are made of vitreous porcelain, with a non-crazing glaze. They are said to combine the snowy whiteness of china with the durability of stone. The letters will last a lifetime without further attention than the occasional renewal of burned-out lamps.

The porcelain electric-sign letters are made concave and of such form that they will reflect the light in parallel rays, enabling one to read the sign at a great distance and at any angle, as illustrated in Fig. 1.

These letters are designed so that they will give the best effect with the smallest amount of current consumption. This design reduces the number of lamps and the candlepower of each, so that a saving of 50 per cent. in operating expenses is said to be secured, at the same time producing a bright, sharply defined letter. Two-candlepower lamps are used in these signs.

FIG. 2. SIGN MADE WITH FIREPROOF PORCELAIN SIGN LETTERS.

The lamps used in the porcelain letters are especially designed so that the light is all radiated from below the face of the letter. This prevents the diffusion of light from one letter to another, and does away with any blurring effect.

The porcelain of which the letters are composed permits the use of color schemes which are permanent. The white face, gold-shaded letter (gold fired on) is said to be one of the most beautiful and the most durable sign letters on the market.

When the signs become dirty they can be washed, and no damage would result if a hose were turned on them, as the letters and sockets are constructed of one integral piece of vitrified porcelain.

The beauty and permanence of the letters compel the makers to use the highest grade of sign body, and they do not spare expense in the selection of materials or in skilled workmanship, as it is not the company's desire to turn out "cheap" signs.

The white concave face of the letters is a reflector which produces a brilliant effect with lamps of even the smallest candlepower, thereby greatly reducing the operating expense of the sign. As these letters are of pure white porcelain, they make a beautiful day sign also.

Fig. 2 shows a neat sign made up. It is made of 16-inch letters and the sign has a royal-blue smalt background and gold-shaded letters. The Colonial company is expecting to establish agencies in every town where lighting current is supplied, and preference is given to the lighting company in placing the agency.

Electrical Exports for October.

The electrical exports from the United States for the month of October amounted to a total value of $1,013,671, as against $844,279 in October, 1903. Goods classified as electrical appliances, including telegraph and telephone instruments, show a decrease for October, compared with a similar period last year, of $7,847. This deficiency, however, is more than overcome by the good showing made by electrical machinery, which shows an increase of $247,809 over the figures for October, 1903. The figures in detail are as follows: Electrical appliances—October, 1903, $430,821; October, 1904, $352,404. Electrical machinery—October, 1903, $413,458; October, 1904, $661,267.

The following-named countries were the principal buyers of American electrical machinery in October: British North America, $169,835; United Kingdom, $120,244; Philippine Islands, $71,378; Japan, $66,754; Mexico, $57,608; British Australasia, $34,740; Germany, $18,806; Argentina, $14,087; British Africa, $13,259; Brazil, $12,347; British East Indies, $8,651; Central American States and British Honduras, $7,906; Columbia, $4,403; Hongkong, $3,774; Cuba, $1,125; Chinese Empire, $1,045.

$40,000 Damages for Death from Electric Shock.

One of the heaviest awards of damages for loss of life ever made in the courts of Kings County, N. Y., was handed in on November 29th by a jury in the Supreme Court in the suit brought by Mrs. Anna C. Morehard against the Richmond Light and Power Company. The plaintiff received $40,000 for the death of her husband from electric shock. Mrs. Morehard is the widow of Dr. Francis L. Morehard, Giffords, S. I. The Morehards had their home wired for electric lighting by the Richmond Light and Power Company, which supplied the electricity for the lights. One night several months ago the lights in the house failed to work. Dr. Morehard went down into the cellar to find out what the trouble was with the lighting arrangements and received an electric shock that killed him. On behalf of the plaintiff it was alleged that the transformer was out of order, owing to the company's negligence, and that Dr. Morehard received the full primary voltage of 2,400 volts, which had passed into the house. The company alleged that the voltage was not greater than that which ordinarily passed into the house. It also alleged that while handling the wires Dr. Morehard himself rubbed off the insulation. Mrs. Morehard sued for $100,000.

The Electrical Fire Hazard.[1]

By C. J. H. Woodbury.

The applications of electricity for illumination and the conveyance of power have outstripped the merely relative conditions of superiority to existing methods and have also reached beyond precedents to the establishment of new expedients.

These vast enterprises have required the largest initial investments during the last 25 years.

The use of copper and consumption of supplies taxed all available resources. It has been the greatest purchaser of copper, requiring the output of the old mines, and stimulated the search for further productive deposits of this useful metal.

The great usage of poles for aerial wires has been one of the elements threatening the forest supply.

The demand of electrical interests for a more economical generation of power at higher standards of accurate regulation has improved steam engines and water wheels, bringing out new types of both, which are also in other industries an advantage to users of power.

The organization of power-generating plants upon a scale whose solidarity inspired confidence in patrons that the product was to be of assured permanence was of itself a new feature in construction.

New tributary industries to fill the gap in insulation between those of submarine cables and electric door bells were established.

The continuous operation of these plants required mechanism whose high standard of construction has stimulated collateral lines of mechanical production and uplifted the character of such work.

Employment has been given to thousands upon thousands, particularly those of high-skilled artisanship.

It has established the new profession of electrical engineering, which has taken unto itself the best in the other branches of engineering, engrafting practical experience upon technical lore, for capital soon found that the useless labor of untrained minds was a most expensive venture.

The pre-eminent service, however, in this development was that rendered by the administrative leaders in these enterprises, who made all things possible by the force of their imaginations, which enabled them to comprehend the possibilities of the future and to endow with confidence the investment of capital in the applications of science for which there were not adequate precedents.

Electric Illumination.

The introduction of electric lighting was never accomplished on the basis of cheapness but on that of quality. Its advantages of brilliancy in illumination, revealing objects as at noonday, showing colors at their true value, applying the light without reference to the limitations of an exposed flame, or the vitiation of air, are all of the highest value in artificial illumination and hitherto without precedent.

It was of great value in all manufacturing, because the perfection of the illumination enabled the production of as good articles under artificial light as by daylight, and this has obviated the well-known differences between summer and winter goods in textiles, as the latter when made to a great extent under gas light during the short days of winter contain a greater number of imperfections.

In some industries requiring accuracy as to color or delicacy in manipulation the working day ended with the sunset.

Whether it be measured by hours or by results, in all cases the use of electricity has added to the working day, and it has aided both the product and the toilers in the benefits resulting from the absence of any vitiation of the air, as is the case to a serious extent by other methods of illumination.

While the sentimental uses of electric illumination may not pertain to this consideration of the question, the fact cannot be ignored that its ministrations to the taste and comfort of humanity are contributions to the general good in the furtherance of happiness and contentment, even to the amelioration of the condition of the rich.

The concentration of electric illumination without regard to the disposal of the products of combustion, as in the case of other illuminants, has been of great value in emergency surgical operations at night, which could not otherwise be performed except by waiting until daylight.

Electrical Conveyance of Power.

The application of electricity to the conveyance of power followed that of lighting and did not reach a full development until the production of large generating units in later years gave scope to its utilities on an economic basis.

This property of transferring energy without dynamic motion between the prime mover and the point of application to the machine has been of the utmost moment in the developments resulting from the removal of mechanical questions from the problems of power transmission.

It has given value to unused waterpowers and harnessed their energy to productive application hundreds of miles distant.

It has modified mill design to the fundamental purpose of construction purely devoted to the operative machinery.

It has changed the location of factories from that of an essential juxtaposition to the site of waterpower or coal supply to those of freight facilities and centers of population available for labor.

The General Fire Hazard.

This reminiscent sketch, indicating the extent and permanence of these achievements of electricity, is presented to call attention to the immensity of the work whose wide range gives rise to great problems when viewed from any standpoint and in any direction.

These questions are so extensive that to treat any one of them equitably it must be considered conservatively.

Among these problems subsidiary to the main questions of construction, operation and administration, is the relation of electricity to the fire hazard, for it is a principle in underwriting that every material possession subject to insurance is to its uttermost details also involved with questions of fire hazard, both external and internal.

It would not be assumed by the lay mind that the stone reservoir which formerly occupied a portion of the park on Forty-second Street and Fifth Avenue, New York, was subject to a fire hazard, yet this structure was damaged over $50,000 by the burning of the Crystal Palace in 1856.

While diminishing the hazards of other methods of illumination, with their attendant mishaps from direct flame, the uses of oil, gas explosions and carelessness with friction matches it must be conceded that electric lighting cannot be claimed to be free from a hazard.

Electric motors, in displacing gas and gasoline engines, or isolated steam boilers with careless attendants, cannot be assumed to remove all fire risk merely because they displaced the burning of highly combustible materials.

In diminishing the use of these methods involving perilous hazard there remains the possible electrical hazard, for this energy which is normally converted into heat at high temperatures when it meets the resistance of arc or incandescent lamps, also produces similar temperatures adequate to ignite anything combustible whenever sufficient electrical energy is diverted from its normal conductors of low resistance and meets with a path of high resistance which converts into heat the portion of its energy devoted to the struggle for the maintenance of the circuit.

Virtually the whole of the precautions for the maintenance of conditions of safety may be summed in the provisions for adequate conductivity and efficient insulation, but in their applications these provisions reach practically to every detail of all electrical plants.

The Underwriters' Rules.

The early installations of electric-lighting plants whose circuits were upon uninsulated wires with earth return caused numerous occurrences which naturally alarmed the underwriters. An investigation by a technical representative of a number of insurance companies and by those of the electric-lighting interests was held, wherein the various incidents which had been the causes of fires were experimentally repeated, and new methods for the installation of plants prepared on behalf of the underwriters.

It was thus noted at the very inception of the commercial applications of electricity to interior lighting that the hazards could be minimized by arrangements which would improve rather than impair the operative conditions of the plant.

The feature of divesting a process of its dangerous elements initiated a new principle in fire insurance which has been widely extended in the technical treatment of various hazards, particularly those of manufacturing processes.

These electrical rules were extended along the lines of the advance of electrical applications, and various technical organizations, municipalities and local boards of underwriters, even individuals and manufacturers, prepared rules whose differences in unessential demands and deficiencies in specifications were sufficient to cause unnecessary vexation and frequent embarrassment, especially to the manufacturing and operative electrical interests.

In March, 1896, the National Conference on Standard Electrical Rules assembled in New York for the purpose of preparing a code embodying specifications covering the conditions of safety in a manner equitable to all the interests involved.

This convention was composed of representatives of underwriters, of those engaged in the manufacture and operation of all varieties of applied electrical apparatus, and also of several scientific organizations.

The various rules were diligently compared and their provisions criticised, and the reports of these meetings with an extensive correspondence containing suggestions were referred to a committee, who prepared the National Electrical Code, which was adopted by the National Board of Fire Underwriters and promulgated by them.

Their committee of electrical specialists meet at stated times to make such amendments, generally by way of addition rather than alteration, as may be necessary to keep in step with the advancing conditions.

It is submitted that this code represents a wider consensus of opinion upon a question of science applied to the service of mankind than was ever concurrently given to any similar question.

These rules are anomalous in their functions. They set forth conditions governing methods of construction, installation and operation of electrical plants, and their specifications receive the utmost consideration from those to whom they apply.

Promulgated by the National Board of Fire Underwriters, they form in their applications the guidance of inspectors of voluntary associations of representatives of insurance companies and do not rest upon any jurisdiction which has power to enforce compliance with their provisions in any manner comparable with the power of the law.

The work of the inspection corps is primarily suggestive in its nature, and as a division it is separate from the insurance rate-making bodies, who, however, consider the electrical conditions in connection with other facts bearing upon estimates of risk.

In the consideration of the functions and jurisdiction of these rules it must be remembered that there can be no exercise of authority without a corresponding measure of responsibility, and as these rules treat upon about everything connected with applied electricity the situation year by year becomes greater and more complex. There is an approach to problems which in the near future may need a stronger body than a voluntary organization, whatever may be the individual constituency of its members, to treat upon the large subjects arising from the congestion of various electric applications, and this administration of the National Electrical Code is being watched with interest in comparison with that of the methods used under the authority of the law in various countries on the other side of the Atlantic.

It is no disparagement to the valuable work of the electrical committee in the advancement of standards of electrical installation and proscription of inferior methods to remark that in the confidence of equitable treatment the electrical interests have co-operated with the underwriters in giving of their specialized skill toward the solution of the difficulties of hazard which have been raised. The improvements of their own apparatus have contained the suggestions of new rules. Slate switchboards made by electrical-lighting companies inspired rules asking for slate switchboards; tubular fuses begat rules to match; telephone companies made protectors to defend their harmless plant, and protectors were demanded; power plants were equipped with circuit closers, and such devices became enruled. Study the evolution of these rules as one may, it will be seen that throughout the whole code the electrical interests were the pioneers in the means for the preservation of plant and the maintenance of continuous service.

All electrical interests appreciate the value of a standardization of methods and expect a similar consistency in their application.

It is not necessary in this connection to specify in detail the methods of providing conditions of safety, as this would approach a paraphrase of the code, which is a manual of over 100 pages, freely distributed to all interested persons, and is familiar in its details to those engaged in installation or manufacture of electrical apparatus.

Yet it may be worth while to refer to some of the general methods to which it applies.

Aerial Lines.

The available routes for aerial lines are so limited that there are frequent instances of propinquity requiring every precaution to be taken to prevent cases of accident to poles or wires, such as would result from any contact between the high-potential wires and those of other systems.

The action of town, county or municipal authorities frequently requires locations of these various lines to be so near together as to be incompatible with conditions of safety.

A United States court has compelled the separation of lines of poles carrying telephone and extra high-potential wires to a distance equaling that of the highest pole, so that in case of a broken pole or wire there could not be any contact between the two systems. While such separation accomplishes the desired result, yet there are many places where there is not sufficient available space for such diverse routes. The Niagara Falls power line has a separate right-of-way, as do numerous other electrical-power lines.

In many instances the owners of telephone and electrical-power lines have mutually arranged to change their routes wherever necessary in order to provide sufficient distances between the several routes, and these agreements have been confirmed by the authorities; in other instances the permission for separation has not been granted.

Wherever these various lines approach each other more closely than referred to above, then it is necessary to use every possible precaution against breakdowns by the adoption of extra heavy construction, thoroughly guyed and braced as occasion may require.

However much the lines may be separated in their general routes, it is inevitable that there should be cross-overs.

In such cases it is desirable that the high-potential wires should be above the telephone lines, as they are of larger diameter and therefore less liable to breakage, and being fewer in number there is the lesser chance of occurrences. The telephone linemen are so accustomed to the innocuous telephone wires that they may inadvertently neglect to observe the

1. An address before the Brooklyn Institute of Arts and Sciences on December 6, 1904. Mr. Woodbury is assistant engineer at Boston for the American Telephone and Telegraph Company.

proper precautions for safety if the high-potential lines were below.

In a cross-over the best condition is when the poles at the ends of the cross-over span are so much above the lower span that a wire breaking at an insulator on the upper span would not be long enough to reach the lower span.

That the pole construction should be substantial and well guyed is an evident feature of these cross-overs.

The end wires on the upper line should be covered by wire loops, known as end-insulator guards, to prevent a wire from jumping over the end of the cross-arm in case of the breakage of an insulator or other mishaps sundering the relation of the wire to the cross-arm.

The wires at the ends of the upper cross-over span should be dead-ended to double-grooved transposition insulators and the line completed by a loop to prevent overhauling in case of a broken wire.

In some instances where it is not feasible to make the upper span at such a great height as the above requires, then a screen of wood strips across a pair of suspension wires affords protection against a contact of the two lines.

A joint pole does not afford a desirable means for a cross-over, as the whole construction is confined to a single pole, but where it is used the upper line should have a transverse frame supporting guard wires and end guards to prevent contact in case of broken wires.

Underground Wires.

The obvious obstruction which overhead wires presented to the operation of the fire departments early gave rise to a public opinion in favor of placing the wires underground. This was far in advance of the state of the art enabling telephonic transmission through cables, and required the development of a new art in the production of underground conductors whose wires should be insulated in such a manner as to permit telephonic transmission and also the development of the continuously drawn lead sheath.

When this was accomplished the telephone wires were placed underground in cities, because the number of the wires was beginning to tax the possible pole capacity.

The largest pole line carried 250 wires, and single cables are now made with 1,200 wires or four and four-fifths times as many circuits, and single underground conduits contain ducts for 90 cables, or over 40 times the capacity of the largest pole lines.

Underground wires were not a refuge for safety from the troubles of overhead lines, for they have difficulties of their own. They are a target for pick and crowbar of laborers on other underground work in cities. Street rollers have crushed them, and strokes of lightning have not only wrought havoc with their wires, but fused them in the ducts. The insinuating leaks from gas mains penetrate ducts and manholes, where they cause destructive explosions.

In times past when attractive propositions of municipal action or other relations caused joint conduits with high-potential wires in the same underground system with signaling wires the electrical leakages of the former were the cause of numerous destructive crosses. The Supreme Court of New York has decided against this manner of joint use of a conduit system.

Electrolysis.

The chemical effects of electricity are well known as a most active agent in industrial chemistry, particularly in electrotyping, where metal is removed from one mass and deposited upon another article. Electricity is used to make and to break molecular combinations in many lines of chemical industry, as the manufacture of aluminum, sodium and other metals, also carbide of calcium, soda ash and other compounds.

In like manner with the single-trolley railroad system the portion of the electricity passing through the earth between the moving cars and the ground plate at the central-power station applies a portion of its energy in making various chemical changes in the earth, many of them to the serious detriment of underground pipes and electric cables.

Any impairment of underground water pipes to the point of rupture is certainly a live issue in the questions pertaining to fire hazards, and hardly less so is any injury to underground conductors connected with the fire-alarm or the telephone systems which are such essential features in the reduction of the fire loss by the prompt manner in which they are able to summon the fire department.

These underground currents remove metal from such buried conductors and also form caustic potash and other alkalies by the electrolysis of alkaline sulphates or chlorides.

If these are formed near to underground conductors they are not corrosively active upon them until the generating current ceases or is greatly reduced.

Metallic sodium has been formed by the dissociation of sodium hydrate in cement by currents of electricity and such events have occurred in buildings where the presence of moisture caused the rapid oxidation of the sodium, producing heat which set fires.

The magnitude of these underground changes may be noted from the large masses of these electro-deposited materials, sometimes a yard in diameter, which becomes attached to the ground plates at central-power stations.

The method of preventing the destructive effects of electrolysis is to attach the positive side of the generators to the trolley wire so that the return current tends to build deposits upon the underground conductors beneath the area traversed by the moving cars. In the vicinity of the power house the destructive effects of the current leaving the underground pipes and cables for the ground plate would be more active than under any other condition of affairs unless conductors reached to the ground plate from such of the pipes as were positive to the earth.

The arrangement of these connections is made from the data of surveys of the electric potential of various conductors to the earth; where it is negative, metal is not being removed from the pipes, and where the electric polarity is positive there is need of bonding to the ground plate.

New electric lines or bridges alter these conditions so that frequent surveys are necessary to preserve the conditions of electrical neutrality. The new East River Bridge and the introduction of electricity as a motive power on the elevated railroads made many changes in the potential map of New York city, in which the lines of equal potential were drawn like the contour lines of equal elevation upon the map of a hilly country, the positive area near the power station being shown in a dark tint.

This line of treatment will stop further destructive results from return currents if applied along these lines, but it is necessary that the work should be done properly and a constant espionage maintained to reveal changed electrical conditions.

Inside Wires.

There is no department of electrical construction which is less properly the subject of amateur work than inside wiring, and none which has been the purpose of more misapplied industry, with the expected adverse results.

There is more constructive detail to the design and arrangement of inside wires than can be taken into consideration at this time. The essentials of wires of ample conductivity are established by a table of sizes which limits the possible rise in temperature of any wire about 30 degrees Fahrenheit.

The selection of insulating material is based upon its exposure to water and dampness.

The possibility of contact with other conductors must be prevented by tubes or other methods of guarding, especially when passing through floors or other portions of buildings.

In manufacturing buildings the wires may be placed upon suitable fixtures, but in commercial buildings and residences where they would be unsightly they are drawn into pipes run through the walls and floors. The modern architect leaves channels in the walls and floors for such tubes, as is done for water and steam pipes. These tubes are to protect the insulation from injury, but they are not insulators.

The switches in electrical systems are the subject of careful design in order to provide that the several conducting parts will be of ample conductivity when closed to convey without heating the currents to which they may be subjected, and whose operation is such that they shall not form arcs when opened.

The most important part of a lighting plant consists in the safety fuses, which are pieces of easily fusible metal introduced in the circuit and of such dimensions that they will be melted by the heat resulting from an undue excess of current.

These safety fuses were first made for the purpose of protecting the filaments of incandescent lamps from destruction by slight increases in the current and afterward applied for the broader purposes of protecting a whole system by opening the circuit whenever the current exceeded its normal quantity.

The heat at the instant of deflagration is sufficient to vaporize a portion of the metal and to throw around small drops in a state of fusion. This in itself would be a cause of fire if the fuses were exposed to combustible material, but for interior wiring it is necessary that they should be suitably enclosed.

The use of open fuses on the motors of street cars has been the cause of numerous fires in transit.

The first line of improvement was to enclose the fuses in tubes and the violence of the deflagration would heat air sufficiently to rupture the arc and aid to the efficiency of the operation of the device.

This was followed by methods of reducing the volume of air by means of asbestos braid around the fuse or filling the tube, except a small air space at the middle of the fuse, with a powder of refractory material, which would not be vitrified by the heat of the arc. These methods reduced the violence of the detonation and also permitted the more accurate calibration of these protectors.

Fire Alarms.

Any allusion to the fire hazards of electricity would be seriously defective, if it did not make mention of the work of the same agency directly in the benefit of the reduction of the fire loss, through the alarms given by the signaling systems.

The electric fire alarm, when first brought out, did not receive any serious attention until the city of Boston bought the territorial right of the patentee, and the results immediately became so valuable that similar alarms were installed throughout other cities.

The automatic fire-alarm systems, in spite of their excessive complications, have been of great value in the concentrated large risks in cities and large manufacturing establishments.

Every telephone is a fire alarm, by which the unskilled can at once state to the fire department the details of place and condition of the occurrence.

There is a secondary hazard to these signaling systems, owing to the fact that in the extent and ramification of all electric wires there are liabilities of mishap when, through accident, there is contact of the wires of different systems, and lighting or power currents are imposed upon the delicate apparatus of the telephone system.

Protectors to Signaling Systems.

At the ends of the telephone lines destructive results from such foreign currents are prevented by apparatus which is subdivided into the various functions which it performs, for there has not been thus far any single device of defending the telephone instruments against the whole range of commercial foreign currents and lightning to which they are subjected.

The form of apparatus used by the Bell Telephone companies, which are especially careful in this regard, consists of a device, which is threefold in its nature, inserted in each line wire.

The first element consists of a fuse made of an alloy which forms part of the circuit, and is contained in a tube of vulcanized fiber. These fuses will deflagrate when exposed to currents of seven to 10 amperes, the capacity of the fuse being varied according to the type of the apparatus.

The next element consists of a pair of small blocks of carbon whose larger surface measures about one by one-half inch, and one of these blocks is connected to the telephone circuit. The corresponding block of the pair of carbons is separated from it by a perforated sheet of mica and is electrically connected with the earth. A small cavity in one of the opposite faces of the carbon is filled with a button of solder, such as is used in automatic sprinklers, and which melts at 160 degrees Fahrenheit.

The distance between these carbons, or the thickness of the mica, is 0.0055 inch, being such that electricity at over 350 volts will pass from the carbon connected with the telephone circuit across this space to the opposite carbon and thence to the earth, thereby relieving the telephonic apparatus of electric tension exceeding 350 volts.

Thus, if the foreign current exceeds the carrying capacity of the tubular fuse, its deflagration opens the circuit at that point. If, however, it is less in volume than the carrying capacity of the fuse, and over 350 volts tension, it leaps across the thin space separating the carbons, and thence passes to earth. The resistance of the tiny arc in the space between the carbons is sufficient to slightly warm the carbons, and cause the fusible metal to flow from its recess and fill the space between the carbons, and thus establishes a conductor of low resistance to earth.

This diminished resistance generally causes a sufficient increase in the current imposed upon a line to cause the tubular fuse to deflagrate and open the circuit, if it did not do so on the first occurrence of the contact which imposed the foreign current on the telephone circuit.

At the subscriber's telephone installation the fuses and generally the carbons are placed in the building near to the point of entrance; but in order that the wire leading to the ground shall be as straight as possible, because lightning does not like to follow turns and bends in a conductor, it is sometimes necessary to place the carbons at some other place along the route of the wires in the building. This separation of the parts is required very infrequently, on an average of about one telephone in 20.

In order to protect the fine wires of the telephonic apparatus from injury by currents which are too small to operate the tubular fuse, and of too low tension to pass to earth through the carbon cut-outs, a third element, known as the heat coil, is employed, in which a fine german-silver wire which forms a part of the telephone circuit will be heated by a current of one-sixth of an ampere to a temperature sufficient to release a conductor ordinarily secured by fusible solder, and pass the current to earth. This latter device is not used at the subscribers' end of the line in those modern types of telephonic apparatus in which the circuit is normally open, except when the telephone is in use, because such coils are an interference with the best conditions of telephone service by adding to the electrical length of the line, and if a foreign current came in contact with the telephone line at a time when the instrument was in use, it would produce noises which would absolutely prevent the transmission of speech, and the user of the telephone would naturally place the receiver on the hook, and thereby open the circuit.

The result of this protective apparatus has been so successful as to establish conditions of immunity in the Bell system of telephony against mishaps to the apparatus resulting from foreign currents and lightning after an experience of many years throughout the Bell telephone system. Such a telephone office appears to be, like a locomotive, the safest refuge in a thunderstorm. Notwithstanding the

number and range of location of telephone central stations, it has not been possible to obtain information of any injury by lightning to any person in such a place.

Whenever the distribution of the telephone service is entirely underground, this system of protection is not necessary at the subscribers' instruments, but is in all cases installed at the telephone central office to protect the whole system against foreign currents imposed upon other parts of the system.

The whole telephone system has over 4,000,000 miles of wire, interlaced throughout the country, and in the communications which are daily traversing this vast network from the Atlantic to the westerly side of the Mississippi Valley, or the similar one at the Pacific Coast, exemption against the disturbances resulting from foreign currents throughout this vast territory is secured through these efficient protectors.

The Underwriters' Electrical Bureau.

The whole foundation of fire insurance, which is said to be the second single tax in this country, is based upon a distribution of averages, and in that examination of facts which is the foundation of science, the allotment of the various losses, both as to cause and amount, is the subject of systematic tabulation, whose results furnish the basis upon which insurance rates are levied, for the old method of competitive guessing is a matter of the past.

The causes which contribute to the origin of fires are largely those of chemical reaction, while the resistances to fire are dependent upon construction and fire apparatus.

Thus the modern method of fire-loss prevention is a technical proposition requiring the services of chemists and engineers.

The National Board of Fire Underwriters maintains a testing laboratory, which contains the necessary facilities for making the various investigations required in this study of matters pertaining to the fire hazard.

It is here that the supplies and subsidiary devices of commercial electricity are put to their proper tests, and the results have great weight in furnishing additional features to the National Electrical Code. Its quarterly reports, containing lists of fires caused by electricity, and stating the deviations from the code which are supposed to have been the origin, are a compendium of exact information on the subject.

The Associated Factory Mutual Insurance Companies of New England were pioneers in the application of technical work to the reduction of the fire loss, a task whose beneficent results have extended beyond the mills which form the specialty of this combination.

The underwriters assume a great task in undertaking to maintain inspections of properties as widely extended and as numerous in detail as that of the commercial applications of electricity.

The results show beyond peradventure that the electrical fire hazard is less than that of other methods of lighting and power transmission, while every telephone being a fire alarm, the signaling systems are potent elements in the reduction of the fire loss.

While the diminution of the ratio of such fire losses appears to be due to this work, as the variable element in the problem, the question naturally arises, Will the future permit its continuation to an extent which will be equal to the greater task of meeting the problems of depreciation of plant, and the congestion of the future to which the present applications of electricity are a mere preface?

If the work remains in hands which can exercise the responsibilities to a uniform jurisdiction, then it will be sustained by the dominance of an approving public sentiment.

BOOK TABLE.

Western Electrician's Lamp-lighting Schedule, Moonlight System, for 1905. Chicago: Electrician Publishing Company. Pp. (3½ by 5⅝), 32. Price, 10 cents.

The schedule contained in this book is based on mean local time as given in the calendar for 1905 and applies to a latitude of about 41 degrees, which means, approximately, New York city, Philadelphia, Connecticut, Pennsylvania, New Jersey, Ohio, Indiana, Illinois, Nebraska, Iowa, Southern Michigan and Southern Wisconsin. For adjoining states north or south of above error may be 10 minutes, to be added or deducted from time given for lighting or extinguishing. The schedule is based on the rules of what is known as the "Philadelphia Moonlight Schedule," viz.: "Light one-half hour after sunset and one hour before moonset. Extinguish one hour after moonrise and one hour before sunrise." The book, among other things, contains an article by F. B. Badt giving an explanation of moonlight schedules and mean local time.

A phase of a political campaign has been injected into the effort of securing the construction of an interurban electric railway between Cedar Rapids and Waterloo, Iowa. To stimulate interest in the projected road campaign buttons are being distributed, bearing in the center the picture of a trolley car, while above are printed the words, "Urbana, Brandon, Shady Grove, Jubilee," and below, "The Farmers' Favorite Line; United We Stand."

CORRESPONDENCE.

Great Britain.

London, November 26.—To judge by the notices which have just been published, the coming parliamentary session will be of more than ordinary interest. Taking the early batch of notices there will be an exceptional amount of legislation concerning London and the District. Notwithstanding the issue by the Board of Trade a few days ago of a statement to the effect that no tube-railway bills would be considered by Parliament until the Royal Commission on London Traffic had reported, quite a number of such bills has been deposited, and provided Parliament does not order all such schemes to be put one side until the royal commission's report is presented, we may look forward to a repetition of the proceedings of two years ago, when Mr. Yerkes and Mr. Morgan were in competition. I have no idea who is promoting the line from west to east and northeast which Mr. Morgan promoted in 1902, but it is certain that Mr. Yerkes will be in opposition, as the line in question will compete with the District railway throughout three parts of its route. The fight for this line will be a three-cornered one, as the Central London railway is also applying for powers over a similar route so far as the city is concerned.

Another interesting feature of the notices in connection with London is the wholesale application for powers to supply electrical energy "in bulk" over a portion of it. In the first place there is a resuscitation of the East London and Lower Thames scheme, which was rejected last year by reason of unsatisfactory financial backing, and another huge scheme proposes to supply electricity over the whole of the administrative county of London, crossing the River Thames at several points. When one imagines the opposition which will undoubtedly be offered to this proposal, and especially by the London Borough Councils, it will be seen at once what a tremendous sum in counsel's fees, etc., such a promotion must incur. In addition to these schemes, however, nearly all the London supply companies are asking to be constituted "power" companies in the widest sense of the term, their applications embracing huge areas for the purpose of supplying "in bulk." Probably one of the reasons for these applications is the disabilities under which all the companies now labor in consequence of the definitions of their special acts. Although limited-liability companies, with the widest possible powers under their articles of association, yet these powers are more or less useless to them by reason of the existence of provisional orders and special acts. By the acquisition of the powers now sought the companies would be able to supply in wholesale quantities in all directions for very great distances from their central-generating stations instead of being, as at present, confined to supplying in detail to a comparatively small area. This applies more especially to those companies which have found it expedient to erect their generating stations outside their area of supply.

In connection with the question of the generation of electricity on a large scale, attention may be drawn to a new phase in this direction, and that is the erection by county councils of large power stations for the supply of electricity in bulk to the various towns within the county area. At present no statutory authority exists for enabling such councils to undertake such work, but they could of course apply to Parliament for special powers. This question has been raised on many occasions at the meetings of municipal associations, but the first county to attempt to move in the matter is, curiously enough, the County of Durham, which has already several large power-distribution companies within its boundaries. There are 108 local authorities within the county area and 77 of these have expressed themselves willing to take a supply of energy from the council if a county scheme were inaugurated. Consequently a committee of the County Council has recommended that an electrical expert be called in to advise on the matter, and that subsequently a conference of local authorities be convened for the purpose of discussing the details.

The Swansea corporation and the National Telephone Company having failed to come to terms upon the question of intercommunication, the corporation has decided to take legal proceedings to enforce the carrying out of the statutory obligations of the company. The corporation is now seeking a loan for £2,000 for extending the municipal service.

Little has been heard of the financial position of the National Physical Laboratory lately, but Sir William Abney, in his opening address to the Society of Arts last week, once more brought the subject to the front. The old question of a large annual state subsidy was once more raised, and Sir William Abney and many others feel that unless something of this nature is forthcoming a serious state of affairs will sooner or later ensue. At present a large amount of material and financial help comes from private sources, which in the nature of things must be unreliable, and it is to be hoped that the government will take a generous view of the matter. In view of the most important work now being carried out in the National Physical Laboratory by a highly skilled staff the possibility of financial want overtaking it should be grappled with at the first sign and a movement now would not be too early.

The Dublin corporation has decided to spend no more money upon its electricity works until satisfied that all the work under the consulting engineer's original contract has been duly executed. It was in this connection that the city resident engineer made two reports to the electric-lighting committee. G.

New York.

New York, December 3.—The Chamber of Commerce has emphatically indorsed the proposed action of the Rapid Transit Commission respecting the subway advertisements. August Belmont displays some inclination to yield to public clamor, but the advertisements have not been removed from the subway stations.

The first case of fire in the subway occurred on Thursday evening, when an express train on Lennox Avenue, running into a misplaced switch, did sundry damage, and finally overturned a can of gasoline. The gasoline was presumably set afire by an electric spark. One man was slightly injured before the flames were put out, but otherwise very little damage was done.

The Interborough Rapid Transit Company has issued Dr. Chandler's favorable report on the air of the subway in the form of a small booklet, obtainable by any passenger on request. The Health Department is not yet completely satisfied with Professor Chandler's report, and is making its own confirmatory chemical and bacteriological tests. As far as is now known, the results of the tests tend to confirm Professor Chandler's optimistic views.

On Wednesday evening Subway Contractor John B. McDonald was the dinner guest of the Manhattan Club. Justice Truax, as toastmaster, recited the early experiences and recent achievements of Mr. McDonald, who was asked to accept a bronze statuette representing Victory. Mr. McDonald, in giving thanks, prophesied that in 1905 the subway would convey 500,000,000 passengers.

On the elevated railroad express trains are announced to run from One-hundred-and-seventy-seventh Street and the Bronx Park to South Ferry from Friday next at a five-cent fare. The distance covered is 14 miles, and the time scheduled 52 minutes. The route chosen will be over the new subway viaduct from One-hundred-and-seventy-seventh Street to One-hundred-and-forty-ninth Street, and thence via the Second Avenue elevated to the ferry at the end of the line.

William K. Vanderbilt is reported to have given financial aid to the Niagara, Lockport and Ontario Power Company, which enabled it last Monday to file a certificate with the secretary of state increasing its capital from $1,000 to $10,000,000. It is now believed that the company's plant will be used to generate power for the electric lines in western New York controlled by the Vanderbilts.

Among electrical contracts recently recorded by the Board of Education is that awarded to the O. K. Electrical Construction Company, 725 Broadway.

The sub-station at Flushing, L. I., was opened for use this week, and supplies electric power to a number of lines of the New York and Queens County Railway Company. Current is received from the Long Island City power house at 6,000 volts and stepped down to 550.

Dr. John F. Fitzgerald, general medical superintendent of the New York hospitals, in the annual report to the commissioner of public charities, recommends that electric elevators be provided for the Kings County Hospital, in place of the present hydraulic elevators. The reason given is that in hospitals of this character, where a life often depends on the expedition of operations, delays and stoppages are not so likely to occur where an electric plant is used.

The members of the Old-time Telegraphers' and Historical Association gathered in considerable numbers last Saturday night at the home of Mr. and Mrs. Charles H. Bristol, 277 Stratford Road, Flatbush, Brooklyn. The president of the association is John C. Barclay, assistant general manager of the Western Union Telegraph Company, and the vice-presidents are Francis W. Jones and Frederick Pearce, both of New York.

Cornelius Vanderbilt is one of the financial backers in a plan recently laid before the Rapid Transit Commission to construct a moving platform under Thirty-fourth Street. It is suggested to connect the new Pennsylvania tunnel with the East Side, connecting also with the present subway. Passengers to and from the subway and the elevated roads are to be transferred free. The platform would carry 47,520 passengers an hour, or more than double that of the subway, and could be boarded at every block. D. W. W.

Dominion of Canada.

Ottawa, Ont., December 3.—George Johnston of Ottawa, the Dominion statistician, says that the amount of waterpower actually used for electrical production throughout the world at the present time is over 2,000,000 horsepower. Of this amount Canada uses over one-tenth, or more in fact than any other country excepting the United States. He gives the figures for the United States at 527,467

horsepower and for Canada at 228,225 horsepower hydraulic.

Application is being made to the Dominion government on behalf of Morrisburg, Ont., for the entire surplus of waterpower available in the Rapide du Plat Canal for the purpose of further developing electric power for the use of manufacturing purposes or otherwise as the corporation may deem expedient.

An electric radial line between the cities of Brantford and Hamilton, Ont., is now an assured enterprise. Messrs. Parsons and Leslie of Toronto, Ont., together with the Hon. Mr. Haines of New York are the principal promoters of the undertaking. They form what is known as the Hamilton, Ancaster and Brantford Radial Company. Already they have made definite arrangements for running rights through the various townships along their proposed line.

The cities of Toronto and Toronto Junction will have power and light from other sources than Niagara Falls and the Humber River. The Credit River is now being dammed at Erindale and poles have already been erected. Erindale is a village on a promontory overlooking the Credit. The main dam is of concrete and the water contained by it will cover a large area.

The revenue of the Toronto Street Railway continues to expand, the total for November this year amounting to $198,150, against $174,038 for November of last year, being an increase for the month of $24,111. The revenue of the Toronto railway is now almost as large as the electric street railway of the city of Montreal.

The City Council of Kingston, Ont., has decided to submit a by-law to the people to raise $150,000 for improvements and extensions to the gas and electric-light plants. Of this amount it is proposed to expend $36,000 on the electric-light plant.

The arbitrators in the matter of fixing the price which the city of St. Thomas, Ont., should pay for the gas and electric-lighting utilities in connection with the city's municipal-ownership move have fixed the price at between $240,000 and $250,000. The ratepayers of St. Thomas will vote on the question in January.

The electric power at Kakapecca Falls, a few miles from the city of Fort William, Ont., is to be developed by Montreal capitalists. The water from these falls has a drop of 125 feet and the rights belonged to Chicago people, who have sold to Herbert S. Holt, president of the Montreal Light, Heat and Power Company, and Charles R. Hosmer, president, and F. W. Thompson, vice-president of the Ogilvie Flour Mills Company. It is understood that arrangements have been made for the immediate construction of a plant that will produce 30,000 electric horsepower at the start and 50,000 horsepower later. W.

Winnipeg, Man., December 3.—One of the largest purchases of Canadian bonds made in some months was recently completed when the Bank of Montreal and N. W. Harris & Co. of New York took from the Winnipeg Electric Railway Company $2,000,000 first-refunding mortgage 30-year five-per cent. sinking-fund gold bonds. A deal has just been put through for the amalgamating of the Winnipeg Electric Tramway and the Winnipeg Power Company under the name of the Winnipeg Electric Railway Company. The new company has exclusive control of all the street-railway, gas, electric power and commercial-lighting business of the city of Winnipeg. The Harris Company, which is said to have already invested over $15,000,000 in Canada, is a large holder of the debentures of the city of Winnipeg.

The City Council of Charlottetown, P. E. I., has commissioned the Delano Osborne Company of Toronto and Montreal to prepare plans and estimates for a civic-lighting and power plant.

The City Council of Fredrickton, N. B., is about to install an electric plant to light the municipal buildings in that city.

The city of St. John, N. B., is about to issue $25,000 debentures for the purchase of the Carleton electric-light plant.

Bids are being called for by William Skeene for the installation of electric dumb waiters in the Fairview Hospital, Vancouver, B. C.

The Town Council of Sussex, N. B., has decided to obtain estimates on building a new pumping station and installing an electric-lighting plant.

The British Columbia Electric Railway Company is taking bids on a large addition to its office buildings on the corner of Carroll and Hastings Streets, Vancouver. Mr. Buntzen is the manager. H.

Ohio.

Cleveland, December 3.—The Ohio Inspection Bureau of Columbus has opened an electrical inspection department which will hereafter give special attention to the new construction work in Columbus. H. C. Harris, who was one of the commissioners on electricity at the Louisiana Purchase Exposition, has taken charge of this work. The lighting and power companies have agreed not to connect their service with any new work until it has been approved by the department.

Charles Kohl has introduced an ordinance in the Cleveland City Council providing for the extension of the franchise of the Cleveland Electric Railway Company to 1925 on condition that the company operate on a three-cent fare basis; that is, three cents for a single fare and five cents for passage with universal transfer. The ordinance also provides for municipal control of the car service, authority of the city to regulate routes and provide for extensions and other things of the kind.

The Columbus, Delaware and Marion of Columbus will soon purchase six new cars 54 feet in length and fitted with plush upholstered seats. The business of this road has outgrown the capacity of the present equipment.

At the annual meeting of the Chamber of Commerce at Toledo Tuesday evening one of the interesting features will be five-minute talks on "Interurbans" by men who know what to say regarding them. Warren Bicknell will speak for the Lake Shore; G. B. Boone, Toledo and Indiana; F. E. Seagrave, Toledo and Western; Matthew Slush, Detroit, Monroe and Toledo; C. M. Smith, Toledo, Bowling Green and Southern; Harry Thompson, Lakeside and Port Clinton.

Articles of consolidation between the Toledo and Northwestern and the Ohio and Michigan Traction Company have been filed with the secretary of state at Columbus. The new name will be the Toledo, Ann Arbor and Detroit Railroad Company and the capital stock is fixed at $1,500,000. J. H. Clauss, the well-known cutlery manufacturer of Fremont, will be the president of the new company.

John Snyder, D. H. Snyder, E. H. Ackerson, Frank Patterson and H. L. Rockfield are the incorporators of the Springfield Construction Company, Springfield, which will have a capital stock of $100,000.

The Cleveland, Wooster, Mt. Vernon and Columbus Railroad Company of Mt. Vernon has been incorporated with a nominal capital stock of $10,000 to build a line through Cuyahoga, Medina, Summit, Wayne, Stark, Holmes, Ashland, Crawford, Richland, Knox, Licking and Franklin counties. J. J. Vail, J. B. Graham, James A. Tillen, Fred W. Jones and E. F. Shelley are the incorporators. The Cleveland and Southwestern reaches Wooster and an extension south would be a step toward connecting Cleveland with Columbus.

The Columbus, Buckeye Lake and Newark has put on a limited car for Sunday traffic that will make the trip from Columbus to Zanesville.

The light committee of the Toledo City Council has decided to advertise for bids for city lighting for the term of five years. A resolution had been adopted calling for bids for from two to 10 years, but this was reconsidered. Some changes have been made in the conditions of the ordinance under which the lighting has been done heretofore.

The Galipolis Gas and Coke Company, Galipolis, has applied for an injunction restraining the City Council from putting into operation two ordinances reducing the prices on gas and electric lighting. The company claims to have sustained a loss of $10 in the operation of the plant for the year ended January 22, 1904.

Electric switches are being installed at several points on the lines of the Toledo Railways and Light Company. They are all controlled by the motorman in his cab. If they prove satisfactory the company may put them in all over the city. Three different makes are now being tested.

The board of review has added $554,440 to the tax valuation of the Cleveland Electric Railway Company. The company had already made a voluntary increase of $53,000.

An ordinance is being prepared for a special election in Cleveland that the people may vote on the question of giving a franchise to the Cuyahoga Light and Power Company, a new concern which proposes to furnish current for light and power.

Louis E. Beilstein, vice-president and general manager of the Toledo Railways and Light Company, has denied the report that he has resigned to take a more important position. Harro Harrsen has tendered his resignation as assistant general manager and will go to Mexico. O. M. C.

Indiana.

Indianapolis, December 3.—The electric-railway situation in Indianapolis is assuming an attitude of high tension. Charles S. Hernley, Robert Churchman, D. M. Parry and others, promoters and incorporators of the Indianapolis and Eastern Indiana Electric Railway Company, are asking for an independent entrance or right-of-way into the city, and assert that they secured the consent of the property owners on the streets over which they wish to build their line and on which they propose to do a freight as well as passenger business. Indications are that during the 60 days of legislation the interurban question will afford matter for the biggest fight of the kind that ever took place in the state.

J. W. Chipman, secretary and general manager of the Indianapolis and Eastern Railway Company (Greenfield line), is arranging to make the longest continuous trip ever attempted by an electric car. With a party of invited guests representing the city administration, the Commercial Club, electrical engineers and the eight other interurban lines entering Indianapolis, he will take a car from Indianapolis to Dayton, Ohio, via Richmond, thence to Springfield, Columbus, Newark and Zanesville, back to Columbus and thence to Troy via Springfield, from Troy to Lima via Piqua, thence back to Dayton via Covington, from Dayton to Cincinnati via Lebanon and return via Dayton to Indianapolis. "This journey over the numerous connecting interurban lines," Mr. Chipman says, "will advise the public of the vastness of the interurban systems of the two states and give some idea of the growing travel over the interurban lines, each line serving as a feeder for the others."

There is an aggressive campaign on now in this state for the creation of a state railroad commission, and the shippers' association is having bills prepared for introduction as soon as the Legislature meets. These bills will include interurban roads along with steam roads and will likewise place them under the jurisdiction of the commission.

A bill is being prepared to make it unlawful for a railway company to ask for a subsidy tax in aid of the construction of its line. It is generally understood that the subsidy method of obtaining aid for the building of electric lines has been abused in this state.

A new electric line is being promoted from Connersville to Cambridge City. The plan is to lease the old Lake Erie and Western road between Milton and Beeson, connecting with the electric line between Milton and Cambridge City, now operating, and to obtain a private right-of-way from Beeson to Connersville. Another line which it is proposed to build early in the spring is a road from Toledo, Ohio, to Kendallville, Ind. F. E. Seagrave, who has constructed a number of lines, is back of the project and is said to have financed the road. It will be known as the Toledo and Western and is destined to become an important link in the chain of electric lines to connect Chicago and Cleveland.

The Terre Haute Traction Company reports great progress in the purchase of a right-of-way for a line from Terre Haute to Paris, Ill. The route will be through Sanford, Ind., and Vermilion, Ill., and the length of the line 20 miles.

The City Council of Michigan City has granted the Chicago, South Shore and South Bend Railway Company an extension of time until December 31, 1905, in which to complete its lines through that city on condition that the route be changed somewhat from that set out in its franchise.

The Indiana Supreme Court has decided that neither the driver of a vehicle nor a street-car company has the exclusive right to the street, and where a motorman negligently runs his car against a vehicle in front of him which is being driven along the tracks and fails to turn out the company is liable.

Frank S. Whitman of Elgin, Ill., has brought suit for foreclosure against the City Light and Power Company of Dunkirk, Ind. A receiver is asked for so the work of operating the plant may not be disturbed.

The Terre Haute Board of Public Works has decided to recommend to the City Council that the bid of the Terre Haute Traction Company for electric-lighting the streets at $75 a lamp per year be accepted.

Samuel J. Smallwood has obtained a franchise for the installation of an electric-light plant in Bartlettsville.

The Business Men's Industrial Association of Mishawaka has closed a contract with Herman Roemunder by which a plant will be establisbed in this city to manufacture a convertible street car. S. S.

Michigan.

Detroit, December 3.—The Detroit, Monroe and Toledo Short Line, recently completed between Detroit and Toledo, made the run of 42 miles from Monroe to Detroit in 50 minutes. The car left Monroe at 8:55 and arrived at the city limits at 9:45, making 10 stops en route.

The securing of the right-of-way for the Detroit and Bay City Traction Company is progressing satisfactorily. Ninety-six miles between Bay City and Detroit has been secured, and but half a mile of right-of-way is lacking between Bay City and Quannicassee, the first section of the road. The chief engineer states that the building operations will probably be begun within 30 days.

Louis Schneider of the Detroit United Railway recently entertained a party of his friends on the special car "Yolande," taking them to Port Huron for dinner.

The new limited service on the Detroit, Ypsilanti, Ann Arbor and Jackson railway has been inaugurated, and a large number of passengers have been carried on the new Blue Label cars. The new arrangement reduced the service for local traffic from half-hourly to hourly service.

The streets of Battle Creek are being pretty well filled up with street-car tracks. The two new roads, the Battle Creek and Coldwater interurban and the Battle Creek and Grand Rapids interurban, which call for 20 more streets in their franchises, will fill up the town with electric tracks.

Articles of association have been filed by the Hammer Motor Company, with $10,000 capital stock, of which $1,000 has been paid in cash and $2,000 in other property, including drawings, patterns and patents. Henry F. Hammer, Leon J. Paszki, Foster W. Allen and Harry W. Nichoalds are the stockholders. C. G. W.

Texas and Mexico.

Austin, Texas, December 1.—A. M. Fisher of Waco, Tex., will probably install an electric-light plant at Uvalde, Tex. The City Council of Uvalde has granted a franchise to J. H. Gerhart to construct and operate a street-railway system in the city.

The Dalhart Ice and Electric Company will install an electric-light plant at Dalhart, Texas.

The electric street-railway system at Laredo, Tex., which is owned by G. Bedell Moore of San Antonio, is to be extended and greatly improved. Frank E. Scovill has been made manager.

An electric-light plant is to be installed at Kirbyville, Tex.

It is announced by W. W. Wheatley, general manager of the Mexican Tramways Company, that the right-of-way has been secured for the construction of a double track from the City of Mexico to the suburb of Churubusco. The material for the construction of this double track has been ordered from the United States. Mr. Wheatley also says that the mule-car line which runs from Tacuba to Atzcapotzalce is to be immediately converted into electric traction.

The official starting of a large amount of new machinery recently installed by the Mexican Gas and Electric Light Company at its plant at San Lazaro, a suburb of the City of Mexico, took place a few days ago. President Diaz honored the occation with his presence.

W. C. Greene, extensive mine operator, has taken the preliminary steps toward establishing a large hydroelectric power plant at the junction of the Arros and Yaqui rivers in the state of Sonora, Mexico, and to construct transmission lines to Cananea and other places in this section, where the power may be utilized in mines and smelters. The distance from the proposed site of the power plant to Cananea is about 80 miles. The plans of Mr. Greene contemplate the development of about 30,000 horsepower, all of which, he says, will be utilized. The surveys for the proposed plant are now in progress and its construction will soon be commenced.

The Mexican government has granted a concession to the Villanueva Company to establish an electric-power plant on the San Geronimo River in the state of Jalisco, Mexico.

The federal government of Mexico has just entered into a new contract with the Mexican Light and Power Company for lighting the City of Mexico for a period of 10 years. The new contract increases the number of arc lights to 1,200 to burn 4,000 hours annually. The annual sum to be paid by the government for the lighting is $325,777. The company is authorized under its new contract to operate its dynamos either by steam or waterpower.

The Tetela Mining Company will establish an electric-power plant on the Rio de la Canada in the state of Puebla, Mexico, for the purpose of generating motive power for operating large reduction works which it will establish at Tetela de Ocampo

Ernesto Brunel has obtained a concession from the Mexican government to establish an electric-power plant on the Zacapu River in the state of Michoacan, near the town of Sabino, Mexico. He is authorized to import free of duty the machinery, etc., which will be required in the erection of the plant.

There is brisk rivalry between the persons who are seeking the franchise from the city of Culiacan, Mexico, to establish an electric-light plant, street-railway system and telephone system for the city. An American company has made application for the franchise, as has also Oscar Braniff, a wealthy citizen of the City of Mexico.

The Mexican Tramways Company has been granted authority to construct a double-track electric car line giving direct communication between Los Angeles and Nino Perido, suburbs of the City of Mexico.

David R. Retana of the City of Mexico has made application to the Mexican government for a concession to establish a large hydraulic-power plant on the Poliutla River in the state of Guerrero. He will also establish a large system of irrigation in that state.

The 90-day option held by S. L. Pearce of Chihuahua, Mexico, for the purchase of the street-railway lines of Chihuahua and the steam railroad which runs from Chihuahua to Santa Eulalia has expired without the transaction being made. The matter may be taken up again later on.

Parraga Bros., who are operating large salt mines near Salina Cruz, Mexico, are building an electric railway five kilometers long to connect the works with Salina Cruz in order to facilitate the shipment of the salt over the National Tehuantepec railroad. A cable line is being built up the mountains where the beds of salt lie.

An electric-light plant has just been installed at Tenosique, Mexico.

The recent inauguration of the new electric-light plant at Tampico, Mexico, was an industrial event of importance to that city. Governor Pedro Arguellas of Victoria attended the ceremony. Amador N. Jaurigui is president of the company which installed and is operating the plant. In addition to providing light for the city and for private consumers it will furnish power for a number of industrial concerns in Tampico.

Rafael M. de Arozarena, who owns the street-railway system of the city of Puebla, Mexico, has increased the equipment of the lines by purchasing 40 steel cars in the United States. These cars will be used in the freight traffic of the road.

A project is on foot to construct an electric railway from Casas Grandes, Mexico, to the Guerrero basin, a distance of 80 miles. It is said that an American syndicate is promoting this project and that the survey for the proposed line is now being made. It will traverse a section of country rich in minerals and a heavy freight tonnage of ore and other material and supplies is assured from the start. The route of the road is through a rough region of country. H. C. Daugherty of Jesus Maria, state of Chihuahua, can give information in regard to the enterprise. H.

Pacific Slope.

San Francisco, December 2.—The trustees of Fresno, Cal., are advertising for sealed bids for furnishing all material and labor to install a complete battery system and equipment for the fire-alarm system at that place.

Isador Fuchs, who has a franchise in Baker City, Ore., for building a street-car line to be operated by electricity, has all the arrangements completed for the construction of a line between the railroad depot and the Natatorium, a distance of 1½ miles. It is possible that the road will be extended to Haines, a distance of about 14 miles.

J. V. Lewis of Wallula, Wash., states that a plan is on foot for the construction of an electric railway from the Homily Rapids to the Horse Heaven section, a distance of about 40 miles.

The United States Electrical Manufacturing Company has been incorporated with principal place of business at Los Angeles, Cal. The directors are C. Maxstadt, F. Maxstadt, I. J. Francis and others. The capital stock is $5,000.

It is expected that soon after the first of the year the Murphy Water, Ice and Light Company will erect an independent electric plant at Needles, Cal., which will be used to light the city.

W. T. Foreman, J. M. Miller and T. H. Sullinger have applied to the supervisors of Colusa County, Cal., for a franchise to construct and operate an electric railroad along the roads of Colusa County. Bids for the franchise will be received by the board up to December 17th. J. W. Crutcher is county clerk.

The electric-light plant at Orcutt, Cal., the new town on the Pacific Coast railway, is being enlarged.

The trustees of Orange, Cal., have passed an ordinance providing for the calling of a special election to vote on the proposition of securing a municipal-light and power system and other improvements.

The North Mountain Power Company has petitioned the board of supervisors for a franchise to erect poles and suspend wires along the roads in Humboldt County, Cal., for the purpose of conducting electricity for power and lighting purposes. Bids for the franchise will be received by the board up to 10 a. m., December 15th.

John McNear has decided to extend the Petaluma, Sebastopol and Santa Rosa electric road to Point San Pedro, Cal.

The Bull River Mining and Power Company of Fort Steel, B. C., intends to install a large power plant for the purpose of furnishing lights and power to the mines in the Kootenay Valley.

Geary Kimbrell of Pendleton, Ore., has gone to the Upper Umatilla River for the purpose of making preliminary surveys for a power site for the Umatilla Electric Power Company.

The Council of Philomath, Ore., has granted the right to construct and maintain an electric-light system in Philomath to A. B. Horning, who is installing a lighting system that will meet all demands for electrical illumination.

C. A. Lunceford of Davenport, Wash., president of the Adams County Electric Transit Company, states that a dam 150 feet wide and 100 feet high is to be built at the Narrows, which, together with a power plant and machinery installed ready for operation, will cost $540,000. This company proposes to build an electric railway in Adams County. The projected route touches the Great Northern at Harrington, Mohler and Edwall; the Northern Pacific at Sprague and Ritzville; the Washington Central at Reardan, Mondovi and Davenport, and the O. R. and N. at Kahlotus, St. John and Colfax.

The Century Electrical Works of San Francisco intends to erect a large factory at Point Richmond, Cal., for the manufacture of electrical apparatus. The plant will be located near Ohio Street and Broadway. The plans provide for a factory costing about $35,000. A.

PERSONAL.

Lord Kelvin has been elected chancellor of the Glasgow University.

Alonzo Burt, president and general manager of the Missouri and Kansas Telephone Company, has returned to Kansas City from an extensive tour of Europe, where he has been spending his vacation. He announces that his company is to make extensive improvements to the telephone system in Kansas City and neighborhood.

Henry L. Doherty of Denver, former president of the National Electric Light Association, is chairman of the general committee of arrangements for the 1905 convention of that association in Denver and Colorado Springs, and his selection will go far to make the convention the brilliant success which is anticipated. He has appointed John Craig Hammond chairman of the advertising committee. It is evident that Denver is going to impress on every electrical man in the country the fact that a big electrical convention will be held in Colorado next year.

Secretary Thomas R. Mercein of the Northwestern Electrical Association, who was in Chicago last Saturday, thinks that the outlook for next month's convention of the association in Milwaukee is good. Promises of several timely papers have been secured.

A despatch from Schenectady reports the death of Cyrus H. Kendall, assistant foreman in the testing department of the General Electric Company's works, whose home is at Norfolk, Conn. Death resulted from a shock obtained in coming in contact with a wire carrying 2,300 volts. Mr. Kendall was 22 years of age and a graduate of Yale.

Richard W. Mead, assistant to the president of the New York City Railway Company, lessee of the Metropolitan street-railway system, New York city, has resigned to accept the presidency of the New York Transportation Company, made vacant by the resignation of Henry Sanderson. The office vacated by Mr. Mead will be abolished and the duties performed by him will devolve on Vice-president Frank S. Gannon.

ELECTRIC LIGHTING.

The city of Lake Charles, La., contemplates installing an electric-light plant.

Lafollette, Tenn., is soon to have a modern electric-light plant to supply its 8,000 people.

W. O. Crumpler has applied for a franchise to construct an electric-light plant at Vicksburg, Miss.

Edwards & Edwards have succeeded to the electric-lighting business of Edwards & Brinkerhoff of Eureka, Kan.

The Colonial Beach (Va.) Electric and Power Company has been incorporated with W. S. Combs, F. F. Ninde and W. F. Renshaw as its officers. The capital is $25,000.

The pioneer mining town of California, Copper City, is now lighted by electricity, the Northern California Power Company having recently extended its line to that city.

J. E. Edwards of Forsyth, Mont., has secured a site for the erection of a power station for the proposed electric-light plant. The building will be rushed to completion.

The Harper's Ferry Electric Light and Power Company is enlarging its plant at Harper's Ferry, W. Va., and contemplates extending its lighting facilities to nearby towns.

An order has been passed by the Chicago City Council requiring all firms or corporations operating electric-lighting plants without a franchise to secure the latter within 30 days.

The Marion Light, Heat and Power Company of Marion, Iowa, is making extensive improvements to its plant. The company has recently secured a new 15-year contract for lighting the streets.

A project is under way to supply the mining camps of Goldfield and Tonopah, Nev., with electric lights and power from Bishop Creek, Inyo County, Cal. The probabilities are that work on the undertaking will begin within a few days.

A. B. Sanders of Shreveport, La., has received the contract, at $37,000 from the city of Lake Providence, La., for the construction of proposed waterworks and electric-light plant after plans by Capt. Arthur Hider of Greenville, Miss.

The Etowah Light and Power Company of Attalla, Ala., has been incorporated, with $24,000 capital, and A. L. Du Pree, J. R. Brown and Adolphus Brown as its officers. The company has purchased waterpower development, and will build an electric plant to furnish electricity for lighting and power.

It is reported that C. K. Durbin and W. S. Iliff of Denver, officers of the Albuquerque Electric Light and Power Company, are at the head of a new company which will establish an electric plant in the vicinity of the American Lumber Company's plant at Albuquerque, N. M.

Sealed proposals in triplicate will be received until December 20th for extending the electric-lighting system at Fort Leavenworth, Kan. Time will form an important consideration in the award. Full information and blank forms of proposal will be furnished upon application to Major D. E. McCarthy, quartermaster, Fort Leavenworth, Kan.

ELECTRIC RAILWAYS.

W. A. Clark is contemplating building a trolley line from Hamilton, Mont., to Missoula, it is said.

Preparations are in progress for more tests of the electric locomotive built for the New York Central to be made in the presence of electrical and railroad experts. The stretch of track laid for this purpose is being lengthened to six miles.

The Belle Plaine and Vinton (Iowa) Interurban, Street and Electric Railway Company has been organized and surveys have been made. The city councils of each place have passed similar ordinances submitting to the qualified voters of the places

the question of granting the necessary franchise for the use of the streets.

The citizens of Logan, Utah, have subscribed $8,000 of the $25,000 necessary for the construction of an electric railway at that place. David Eccles of Ogden, Utah, is behind the project.

The Albuquerque Traction Company of Albuquerque, N. M., proposes to extend its lines to Highlands, but will first construct a line to the American Lumber Company's plant. The company proposes to give the city a first-class electric-car service.

The Adams County Electric Transit Company has floated $3,000,000 worth of its bonds and plans to begin work shortly on its new system with the main line from Spokane, Wash., to the Columbia River. The total length of the road, with its branches, will be over 200 miles. Power will be developed near the confluence of the Spokane River with the Columbia River, and 15,000 horsepower will be developed.

There is strong talk of installing electric motive power on the street-railway lines in Guatemala City, Central America. The current will be secured from one of the electric-light plants that is run by water-power, the power plant being about 30 miles from the city. There are now about seven miles of single-track line, with a prospect of an increase in the near future. At present mules are used. Ricardo Echeverria is general manager of the line.

From figures compiled by the Elektrotechnische Zeitschrift, it is apparent that a considerable development has taken place in electric railways of Germany for the year ended September 30, 1903, as compared with the preceding year. On September 30, 1903, there were 134 railway power stations and 3,692 miles of track, compared with 125 and 3,388, respectively, on September 30, 1902. The capacity of the generators used in 1903 was 133,150 kilowatts and in 1902 120,776.

Elevated railway traffic in Chicago for November shows a small gain in comparison with the corresponding month last year, with the exception of that on the South Side Elevated, the traffic on which for November of last year was abnormally increased by the strike upon the surface lines. Following are the figures of daily average: Metropolitan, 1904, 115,803; 1903, 114,148; South Side Elevated, 1904, 85,160; 1903, 143,398; Northwestern Elevated, 1904, 74,307; 1903, 71,422; Chicago and Oak Park, 1904, 45,759; 1903, 44,691.

By a decision of the Court of Appeals in Albany, N. Y., the Interurban and the Brooklyn Rapid Transit systems of street railways will be required to give transfers to points on any of two lines which they operate in the city of New York. The case in which the above decision was rendered is that of Luke O'Reilly, a Brooklyn lawyer, against the Brooklyn Heights Railroad Company. James S. Lehmaier is chairman of the executive committee of the Transit Reform Committee of One Hundred, which, for the last two years, has been making the fight for free transfers in New York.

A few of the changes in the operation of cars announced by the United Railways Company of St. Louis taking effect after the close of the Fair have been instituted. The Laclede cars that have been going to the south side of the Exposition grounds turn now at the Forest Park loop. The Olive Street cars that have been running to Delmar Garden turn on Hamilton Avenue and go around the Wellston loop. Delmar cars run west to Skinker Road and turn south to the World's Fair, making the loop at the Skinker entrance. Easton cars that have been going to the Pike entrance run only to Wellston as before the opening of the Fair.

According to reports from central Illinois, a line of continuous electric railways from Chicago to St. Louis is a possibility of the near future. The Lincoln (Ill.) News-Herald says: "Large forces of men are engaged in building the interurban from this city south to Springfield, and from Pontiac north to Joliet. One company is engaged on the line from Springfield to Lincoln, whence it is to be extended to Bloomington. Still another company has undertaken the construction of an electric road from Bloomington to Joliet, and that portion north of Pontiac is under construction now. With a line nearly completed between Springfield and St. Louis and a line in active operation from Joliet to Chicago, it is not difficult to see that before very long the entire distance from St. Louis to Chicago will be spanned by an electric road."

The New Jersey Terminal Company, incorporated in Trenton, N. J., recently by A. A. Cook, J. H. Lehman and J. S. Jacobs of New York, with a capital of $2,600,000, intends to reclaim the Hackensack meadows and connect the several railroads crossing them by an electric freight line. It also will build a railroad terminal, wharves and warehouses and bridge both the Hackensack and the Passaic rivers. It is intended to take advantage of the dredging of Newark Bay by the government and build up a great enterprise so that the network of electric-freight roads could be operated between Greenville, where the terminal and warehouses will be, and the roads of the Pennsylvania, Jersey Central, Lackawanna and Erie companies. The work of reclaiming the meadowland has been going on for months and between 500 and 600 acres already have been filled in.

The Chicago City Council has passed the ordinance for an extension of the Northwestern Elevated railroad, which has been before the council for a year. A charge of bribery in securing votes for the ordinance and an attack upon the local transportation committee of the council was made by an alderman. A committee was appointed by the mayor to investigate the charges and report before he signs the ordinance. The extension will leave the main line at Roscoe Boulevard, run west across the Chicago and Northwestern railway, thence north to Montrose Boulevard, and then west to Western Avenue. It is to be built entirely on land belonging to the company, except as it has to cross streets and alleys.

As a result of the successful tests of electric locomotives recently made at Schenectady, it is said that the New York Central railroad will begin work at once to equip its New York and Harlem branch with electricity, instead of waiting a year, as at first intended. It is said to be the purpose of the company to install an electric suburban service between White Plains and the Grand Central Station. In order to do this the tracks will have to be elevated or depressed, both in West Mount Vernon and White Plains. The plans for these elevations and depressions are now being made. The company has already begun work at Glenwood-on-the-Hudson on a large power plant for its proposed electric system between Yonkers and New York city. The power plant for the Harlem branch will be at White Plains.

POWER TRANSMISSION.

The Batesville (Ark.) Power Company has incorporated with $10,000 capital, to develop water-power and transmit electricity for manufacturing purposes.

W. C. Greene of Cananea, Mexico, intends to establish an electric plant to operate the new sawmills of his new timber properties, and the new smelter and nine mills soon to be constructed at the Mulatos Gold Mines in Sonora, Mexico. Power will probably also be transmitted to Nacozari and to Cananea, Mexico.

The San Louis Valley Irrigation, Land and Power Company has been incorporated with a capital of $1,000,000 to build a big reservoir to irrigate land in El Paso, Conejos and Rio Grande counties, Colo., with a principal office in Colorado Springs. Besides the irrigation plant, the company will have a big power plant and supply electric light and power to nearby cities.

A number of concessions for waterpower development have recently been granted in the vicinity of Santander, Spain. French and German firms principally have been studying this field with a view to installing the machinery and electrical apparatus which will be needed. Consular Agent F. Odriozola at Santander states that there is an opportunity for American electrical firms to compete in this field, as previous small sales have given satisfaction. The present projected plants will produce an average of 4,000 horsepower, and in connection with some of them short railways are planned, for which rails and rolling stock will be needed.

One of the latest electric power plants to be organized is the Waynesville Factory Site and Power Company of Waynesville, N. C. The capital stock of the new company is $300,000 and its officers are: President, B. J. Sloan; vice-president, Alden Howell, Sr.; secretary, I. L. Councill; treasurer, Thomas Stringfield; general manager, S. A. Jones, all of Waynesville. The company has under construction a waterpower electrical plant 12 miles from Waynesville, on the Pigeon River, and the first installation of 500 horsepower will be ready for transmission by January 1st. An additional installment of 1,500 horsepower is arranged for to supply various manufacturing plants in the territory tributary to the power.

SOCIETIES AND SCHOOLS.

A strong effort is being made to increase the membership of the Northwestern Electrical Association at the coming convention, to be held in Milwaukee, commencing January 18th. The organization is a good one and the claims of its officers that the practical information gained at the meetings is alone worth many times the cost of membership will no doubt be heeded by electric-light, power and railway companies of the Northwest, all of which are now eligible to membership. The regular gathering together of men of kindred interests is advantageous in many ways. Original papers on subjects of direct interest are read and discussed and there are always present experts willing and able to answer questions relative to the operation of electric plants. Besides, manufacturers and dealers, who constitute the associate membership, exhibit at the meetings new and modern machinery and appliances, thus offering an opportunity for comparison to the operator. Owners, managers and superintendents of electric-light, power or railway plants; electricians, electrical or mechanical engineers, and all persons engaged in the business of generating and supplying electricity for commercial or public use, are eligible to active, and all manufacturers of, or dealers in, electrical machinery, supplies, appliances or material, to associate membership.

PUBLICATIONS.

The "Pretty Girl Calendar for December," issued by the Pittsburg Transformer Company of Pittsburg, Pa., is certainly appropriately named. The advertising is unobtrusive, and the whole effect is tasteful.

An unusually attractive hanger in colors that is being distributed to the trade on application is that of the Moline Incandescent Lamp Company of Moline, Ill. The company incidentally states that the sales of its "Moline" lamps are increasing in a highly satisfactory manner.

A bulletin has been issued by the American Electric and Controller Company describing the "Rheocrat," a controller which is especially adapted to variable-speed motors used for machine-tool drive. The Rheocrat gives a wide range of running speeds, uniform gradation, constant torque and has many other advantages which are described in the bulletin. The exterior of the casing, as shown by an illustration, appears much as does the ordinary street-car controller, but the interior is widely different, containing a small electric motor and commutator device.

A tasteful booklet on "Window Lighting with Fielding Material" comes from the H. T. Paiste Company of Philadelphia. This is the thesis: "If you can show a storekeeper how you can bring people to his door, he will take his chance on getting them inside and making a sale. There is no better, no surer way of bringing these possible customers to his very door than by the drawing power of a handsome front window." Fielding receptacles and rosettes are referred to as making electric window lighting more effective. Many neat illustrations, with prices and other useful information, add to the value of the pamphlet, which was "printed at the Sign of the Ivy Leaf in Philadelphia," and does credit alike to publisher and printer.

"Pumping Machinery" is the title of a 132-page catalogue just issued by Henry R. Worthington of 114 Liberty Street, New York city. The book is printed in two colors. The cover is lined and is printed in black, light green and gold upon a dark-green background, the whole forming an excellent example of the engraver's and printer's arts. The apparatus described in this book comprises all of the types of pumping, condensing and measuring devices developed by this company in the 64 years of its existence, the most prominent being the Duplex Steam Pump, of which Henry R. Worthington was the inventor. Although devoted to one company's products, this publication is in reality an encyclopedia of high-grade practice in the design of pumping machinery.

TELEGRAPH.

At a recent meeting of the Western Telegraph Company in London, Chairman J. W. Barry said the developments in handling war news by the De Forest space-telegraph system at Chefoo, in conjunction with the Western Telegraph Company, tended to confirm the view he had previously expressed that the interesting development of the wireless system might prove a kind of handmaid to the cable system, and the cable companies need not look upon these companies as competitors, but on the contrary as being friends and doing work in the rough and rugged portions of the earth which could only be done by space telegraphy.

An injunction has been granted the Western Union Telegraph Company against the city treasurer of Covington, Ky., to prevent the collection of $1.50 taxes on each $100 receipts at that place. The telegraph company says that the city has no right to levy a tax other than on the franchise and tangible property. The government, in return for giving priority to its messages, it is claimed, gave the company free use of the post roads without hindrance from states or municipalities. The further claim is made that all the streets where the company has lines in Covington are post roads, and therefore the right to levy a tax for their use does not exist in the council.

The challenge for the international cable chess match of 1905 for the Newnes Trophy has been received by the Brooklyn Chess Club from England, but as yet no arrangements have been made for the match, owing, it is said, to the refusal of the cable companies to give the use of their wires at the prices charged in years previous to 1904. This refusal, it is thought, is because the facilities of the cables are too much occupied by the Russo-Japanese war news. The same cause prevented the intercollegiate match last year. Previous to this the average cost of cabling from New York or Boston had been about $20 a game, the six games costing about $120. The increase would bring the cost of cabling to about $300. The British players paying the same price, the total cost of cabling for the two days would come up to about $600. Efforts have been made to interest the Marconi Space-telegraph Com-

pany in the cable matches, but the officers stated that they were not yet ready to undertake so important a contract.

To meet as far as possible the pressing demands for a wider distribution of the daily telegraphic reports of weather observations, arrangements have been perfected for a very generous increase in the number of such reports telegraphed over regular circuits and as special messages. Submarine cables have been laid from Block Island, R. I., to the mainland; from South Manitou to North Manitou Island, Mich.; from Flavel, Ore., across the mouth of the Columbia River to Fort Canby, Wash.; and preparations are being made for laying one from North Nags Head to Manteo, Roanoke Island, N. C.

MISCELLANEOUS.

The commissioner of patents has ruled that a person who has been sued for the infringement of a patent will not be furnished with copies of abandoned applications filed by the patentee merely because he thinks they may assist him. Some connection between the patent and the application must be shown.

The Chicago Warehouse and Terminal Company has been incorporated in Illinois. Its object is to make effective the plans of the Chicago Subway Company to do a general warehouse business in connection with the freight tunnels in Chicago, built by the Illinois Tunnel Company. The new company will develop the Chicago Dock property recently purchased by the Tunnel company, where large warehouses and terminal yards are to be built, it is said.

An "idea broker" is a man who brings people with ideas, often inventors, in touch with capitalists possessing money to invest in good ideas. Such a man recently said: "With 60 per cent. of our applications in the line of mechanical inventions 40 per cent. of these are electrical. It is the great field of endeavor in inventiveness, and it is among these inventors that we find the sanest patrons. The application of electricity in itself is so exact in its requirements that this sanity seems requisite in its experimenters."

The triple-screw turbine-engined steam yacht designed by William White for George Newnes has been launched at Newcastle-on-Tyne. The vessel is a handsome sea-going type of yacht of little more than 1,300 tons. According to the measurements the length over all is 270 feet, 34-foot beam and 20 feet molded depth. Propulsion is obtained by a triple-shafted system of turbine engines with cylindrical boilers. They are calculated to give a smooth-water speed of 15 knots, with a continuous speed of 10 or 12 knots, according to the state of the sea. Ocean speed will be obtained on such moderate coal consumption as will enable the boat to travel about 4,000 miles without having to replenish the bunkers.

The question of raising chestnut trees for a future supply of telegraph and telephone poles is one that is being agitated throughout Maryland, Massachusetts and other eastern states, and in fact as far west as Indiana. In all this region the chestnut is a tree that holds an important place as a timber tree. It will reproduce by sprouting, but it loses its vigor when the root system becomes too old. Trees grown from seed increase both in height and bulk more slowly for many years than those grown from the sprouts. It is not exacting in its soil requirements and sprouts reach a height of seven or eight feet during the first season. Telephone poles are grown in Maryland from healthy stumps in from 35 to 38 years and railroad ties may often be cut in 29 years. According to the last census reports, in Maryland alone the annual market yield of lumber, railroad ties and telegraph and telephone poles amounts to over $100,000, besides large supplies of material for local consumption.

TRADE NEWS.

The electrical firm of Griffen & Noris at Sherman, Wash., has been dissolved and the business will be conducted in the future by Mr. Griffen.

Electrical supply men and dealers of Chicago were the guests last Saturday night at a banquet given by electrical manufacturers at the Grand Pacific Hotel.

The Babcock Electrical Company of Rochester, N. Y., has been incorporated at Albany with a capital of $50,000. The directors are Garrison Babcock, J. L. Hotchkiss and C. T. Chapin.

The Terrell-Hedges Electrical Company has been incorporated with $10,000 capital to manufacture and deal in electrical supplies at Chattanooga, Tenn. The incorporators are N. T. Terrell, M. M. Hedges, W. B. Swaney, Thomas B. Cooke and Battle McLester.

The Southern Electrical Manufacturing Company of Covington, La., has been incorporated with $200,000 capital to manufacture the Simplex arc light. The officers of the company are: President, E. G. Ames of Covington; vice-president, Arnold Heller of New York city; secretary-treasurer, E. J. Frederick of Covington.

A new company under the name of the Kusel & Kusel Automatic Switchboard and Telephone Manufacturing Company, with main office in the Monadnock Building, Chicago, has been launched. The new concern will place upon the market automatic and manual switchboard apparatus. The gentlemen mainly comprising this company are Messrs. I. J. and H. J. Kusel, who have for the last eight years been associated with the Eureka Electric Company.

Sealed proposals will be received at the office of the supervising architect of the Treasury Department until 3 p. m. on December 27th for the installation of a conduit and electric-wiring system for the United States postoffice at Leadville, Colo., in accordance with the drawings and specifications, copies of which may be obtained at the office named or at the office of the superintendent of construction at Leadville, Colo., at the discretion of the supervising architect.

Recent advices from Ireland state that the supply of electrical apparatus, including generating plants, motors and lighting appliances, is rapidly becoming an important department of business in Belfast. Electric motors are now superseding gas engines and direct steam power for many purposes in that city, and in the country districts a start is being made in the application of electric power in the manufacture of linens. In both the shipyards in Belfast extensive installations of electric plant for motor purposes have been made.

It is said in London that several prominent engineering firms, believing that the opportunities presented by India, Persia, Siam and the Far East are of more immediate value than those offered by South African enterprises are devoting their attention to a larger extent than before to the East. Electric railways, fans, motor wagons, improved methods of lighting, artesian-well machinery and domestic conveniences are just now living problems in South Asia, and the field has been covered only to a slight extent. There is a constant demand for inexpensive plants which utilize the latest results of mechanical inventions.

The Navy Department, through the Bureau of Supplies and Accounts, is inviting sealed proposals until December 20th for furnishing various navy yards and naval stations with electrical material as follows: New York yard, insulating tape and steel conduit; Norfolk and Charleston yards, arc and incandescent lamps, switches, circuit-breakers, switchboard panels, dynamo cable, wire, recording wattmeters and miscellaneous electrical supplies; Pensacola and New Orleans yards, weatherproof wire and miscellaneous electrical material. Blank forms and specifications will be furnished upon application to the navy pay offices in the cities named or to the bureau at Washington.

The Supreme Court of Germany has, by its judgment of November 5, 1904, confirmed the validity of the German patent No. 73,830, the property of the Mica Insulator Company, Limited, of the Empire Works, Walthamstow, for the manufacture of micanite plates, and has dismissed with costs the appeal of Meirowsky & Co. of Cologne for the withdrawal of this patent. A few weeks ago the same company amended its English micanite patents No. 10,430 and No. 6,048.

The Cutler-Hammer Manufacturing Company of Milwaukee is building a three-story addition to its factory which will add 50,000 square feet of floor space to the plant. The construction is of the slow-burning type and it is expected that the addition will be ready for occupancy about the first of the year. The cost will be about $50,000. The building will be equipped with the Grenelle system of sprinklers, will be heated by the Paul system and lighted with mercury-vapor lamps. The fire-storage tank, with a capacity of 75,000 gallons, will be located under the boiler room and the fire pump will have a capacity of 750 gallons a minute. The power plant for the entire factory will be in the new building and will be up to date in every respect. As soon as this building is completed work will be begun on an addition to the present office building, to which another story will be added. The third floor of this building will be entirely devoted to the engineering department, while the superintendent, chief of the engineering department, cost department, publicity department and a part of the accounting department will occupy the second floor. The executive offices and the rest of the accounting department will be on the first floor as at present. The works of the Cutler-Hammer Manufacturing Company now occupy an entire block with the exception of a small plot on one corner. Recently this company purchased a plot of ground on St. Paul Avenue, opposite its factory, upon part of which a brass foundry has been erected. Upon the remainder of this property buildings will be erected the coming year for storage and factory purposes.

BUSINESS.

The American Electric Fuse Company of Chicago has received from the official award committee of the Louisiana Purchase Exposition a certificate conferring the highest award upon the company's exhibit of telephone protective apparatus. This official certificate is a handsome document and includes the blue ribbon awarded to the first prize. A number of duplicates of the official award have been ordered for the various branch offices.

The Canadian Westinghouse Company has sold to the Hamilton Cataract, Power, Light and Traction Company for use in its Victoria sub-station at Hamilton, Ont., two motor-generator sets, each consisting of a synchronous motor and a direct-current generator, to be built at the Pittsburg works. The motor-generator sets will be of the two-bearing type, the generators delivering direct current at 550 volts to the railway system, and each being rated at 750 kilowatts. The synchronous motors will take two-phase current at 8,000 alternations and 2,400 volts, and will be rated at 1,380 horsepower. The excess of capacity in the motors is provided so that they may be used for raising the power factor of the transmission system. The Westinghouse Electric and Manufacturing Company, through its agents, Messrs. G and O. Braniff & Co. of Mexico, has been awarded the contract for all the electrical apparatus to be installed at the El Oro Mining and Railway Company, El Oro, Mexico. This contract amounts to nearly $100,000.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued (United States Patent Office) November 29, 1904

775,920. Machine for Collating or Gathering Leaves or Sections of Books. Albert Hess, London, England, assignor to the T. W. & C. B. Sheridan Company, New York, N. Y. Application filed August 15, 1904.

An electric alarm bell is so connected as to give an alarm when the proper number of leaves are gathered together.

775,921. Telephone-call Teller. Henry M. Hile, Canton, Ohio. Application filed July 15, 1904.

An indicating device for indicating the telephone numbers frequently used is mounted on the telephone transmitter.

775,932. Sparking Igniter Device for Hydrocarbon Engines. James W. Packard, Warren, Ohio, assignor to the Packard Motor Car Company, Warren, Ohio. Application filed June 27, 1903.

The sparking device contains a disk of insulating material mounted on a shaft. A contact plate is mounted on the disk and a contact point carried by the governor engages the plate.

775,933. Electric Switch. Isaac H. Parsons, Leicester, England. Application filed February 23, 1904.

A stationary member is provided with fixed contacts and a movable member is provided with a contact arranged to enter the spaces between adjacent fixed contacts. Insulating material is applied to the contact portions of one of the members, so that the movable contact is prevented from making electrical connection with more than one of the two stationary contacts between which it rests.

775,986. Insulator. Samuel Oakman, Cheshire, Mass., assignor to Luther A. Wright, Boston, Mass. Application filed November 7, 1903.

A protecting shield entirely surrounds the body of the insulator and extends downward and outwardly until its outer rim becomes practically horizontal, whereby a broad annular chamber is formed for receiving paraffin or other coating.

775,993. Guard for Trolleys. Joseph B. Short, Wilkinsburg, Pa. Application filed March 1, 1904.

Two trolley wheels are arranged between two flanged guiding plates projecting above the peripheries of the wheels.

776,001. Transformer. William L. Waters, Milwaukee, Wis., assignor to the National Electric Company, Milwaukee, Wis. Application filed August 18, 1904.

Coils are arranged with air passages between them and a core surrounds the coils. A housing incloses the coils and core and has air inlet and outlet openings in the base, the inlet opening communicating with the passages between the coils. A sinuous air passage communicates at its lower end with the outlet opening and at its upper end with the passages between the coils.

776,026. Motor Fan. Gustav E. Jacobson, Newark, N. J., assignor to the Essex Electrical Company. Application filed September 20, 1902.

In a compound motor fan are a supporting rod and a hub pivoted on the rod and having radial arms, each carrying a laterally projecting substantially horizontal pin upon which the fan motor is mounted.

776,028. Speed Governor. Homer N. Motsinger, Pendleton, Ind., assignor to the Motsinger Device Manufacturing Company, Pendleton, Ind. Application filed September 21, 1903.

In a speed governor are combined, with an electric generator, a pawl-and-ratchet mechanism for driving the generator, an electromagnet adapted to separate the pawl-and-ratchet mechanism, and electric connections between the generator and the magnet.

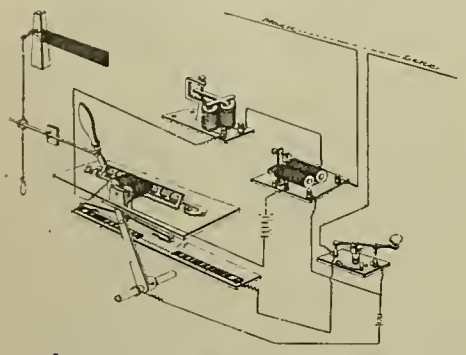
776,064. Trolley. William A. Holland, London, Ohio, assignor of one-half to E. E. Harvey, London, Ohio. Application filed December 11, 1903

Combined with a trolley head are a harp swiveled therein, a trolley wheel mounted in the harp, and means yieldingly retaining the trolley in alinement with the

pole and also serving to detachably connect the harp to the head.

776,067. Multiple Switchboard for Telephone Exchanges. Milo G. Kellogg, Chicago, Ill., assignor to the Kellogg Switchboard and Supply Company, Chicago, Ill. Application filed November 30, 1891. Renewed October 16, 1899.

In a telephone-exchange system are two metallic-circuit lines switched in circuit for conversation. A ground connection is added to the circuit at the central office and a battery and special clearing-out annunciator are in the ground connection. There are a telephone, a switch and a ground connection at each subscriber's station, the switch having contacts to close the ground connection when the telephone is replaced on its switch. The battery has such strength as to operate the annunciators when they are closed to each other on either telephone being replaced on its switch.



NO. 776,120.—TRAIN-ORDER PROTECTOR AND SIGNAL LOCK.

776,068. Multiple Switchboard for Telephone Exchanges. Milo G. Kellogg, Chicago, Ill., assignor to the Kellogg Switchboard and Supply Company, Chicago, Ill. Application filed July 29, 1893. Renewed October 17, 1899.

One side of each line is permanently grounded through its annunciator. Switching apparatus connects together any two of the lines for conversation into a complete metallic circuit, which does not contain either line annunciator. A calling generator at each subscriber's station is located in the main or closed metallic circuit of its line whenever operated to send a signal, either the primary or clearing-out signal.

776,090. Telephone System and Apparatus Therefor. Walter C. Runge, London, England. Application filed December 6, 1902.

Two plug-circuit wires in the exchange are connectible respectively with the two line-circuit wires. A supervisory signal relay at the exchange is in circuit with the first circuit wire and with an earthed battery. Means for earthing the first circuit wire at the subscriber's station are supplied, also means for retaining the supervisory signal in operation when actuated. An electromagnet releases the supervisory signal in circuit with the second circuit wire and a battery.

776,112. Sanitary Rotating Diaphragm for Telephones. Sidney Churchill-Otton, East Melbourne, Victoria, Australia. Application filed May 7, 1904.

A telephone transmitter is provided with a frame having a central opening and a roll carrying a paper diaphragm mounted in one side of the frame and rollers for feeding the paper in front of the transmitter.

776,120. Train-order Protector and Signal Lock. Fryar E. Draper and Edward H. Roy, Nashville, Tenn., assignors of one-tenth to Theodore J. Zoeller, Nashville, Tenn. Application filed January 5, 1904.

In a system of railroad signaling are a train signal, an electric circuit including line signals, a signal-operating lever for actuating the line signal, and a lock for the train signal connected with the signal-operating lever to be simultaneously and automatically actuated with it. (See cut.)

776,144. Automatic Electric Regulator. Alexander McGary, LaGrange, Ill. Application filed April 20, 1903.

In an automatic electric regulator are a solenoid provided with taps, a liquid pot, a series of auxiliary contact points insulated in the walls of the pot and connected with the taps, a conducting fluid within the pot, and means for displacing the liquid within the pot.

776,154. Contact Device for Apparatus for Lighting or Extinguishing Gas. Fredrik Testor, Stockholm, Sweden. Application filed August 16, 1904.

A contact device for electric lighting and extinguishing of gas when a door holt is being pushed or withdrawn is described.

776,160. Telegraph Key. Roye M. Wood, Chicago, Ill. Application filed May 9, 1904.

A telegraph key comprises a base, a block thereon, a leaf spring fastened in the block and carrying the key lever, and blocks adjustable along the spring for regulating the tension.

776,192. Protective Coating or Covering for Storage-battery Plates. Achille Meygret, Paris, France. Application filed June 29, 1903. Renewed April 6, 1904.

A protective coating or covering for storage-battery plates consists of an envelope or sheath formed by dipping the plate or electrode with the active material thereon into a solution containing tetra-acetate of cellulose.

776,214. Electric-railway Signaling System. Marion A. Born, Lawrenceville, Ga., assignor to Early W. Born, Norcross, Ga.; Edward W. Vance, Buford, Ga.; Milton Hopkins Loudon, Kansas City, Mo., and Emma Byles, Washington, D. C. Application filed March 11, 1902.

Combined with the traffic rails are a continuous bare conductor disposed adjacent to one of the traffic rails, a revolubly adjustable hanger arranged on the car or train, and a pair of independent trolley-supporting arms carried by the hanger and having trolleys for engaging the conductor and one of the traffic rails.

776,218. Self-soldering Heat Coil. Frank B. Cook, Chicago, Ill. Application filed January 11, 1904.

The main features of the coil are fixed members, a heat-producing means, a toothed drum inclosing the heat-producing means, and means for turning the drum upon the fixed members and thereby controlling a circuit.

776,220. Controller for Electrical Vehicles. Henry H. Cutler, Milwaukee, Wis., assignor to the Cutler-Hammer Manufacturing Company, Milwaukee, Wis. Application filed April 15, 1903.

Combined with a suitable controlling circuit are electromagnetic windings connected therewith and adapted to respond to variation of voltage, and means for varying at will the voltage impressed upon the controlling circuit without altering the resistance of the controlling circuit.

776,223. Means for Controlling the Voltage from Electric Generators. Isidor Deutsch, Montreal, Canada, assignor to the Electric and Train Lighting Syndicate, Montreal, Canada. Application filed April 30, 1903.

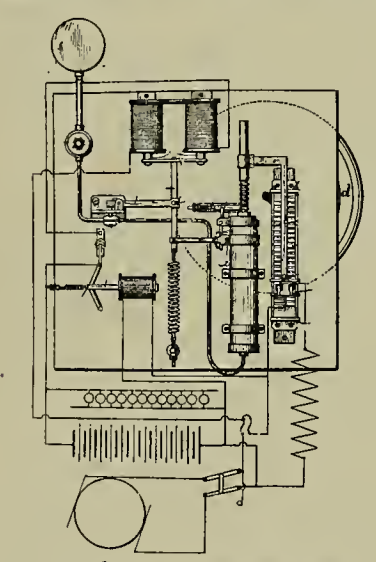
Apparatus for controlling the voltage from an electric generator consists of a main exterior circuit, a shunt field circuit, a rheostat located in series with the shunt field circuit, a vertical row of contacts connected with the steps of the rheostat, a carriage traveling in suitable guides over the row of contacts and co-acting contacts secured to the carriage. A piston and cylinder attachment operated by an expansible fluid and controlled by a solenoid locking device operates the contacts. (See cut.)

776,225. Fireproof Shutter System. William L. D'Olier, Philadelphia, Pa., assignor of one-half to George M. Newhall, Philadelphia, Pa. Application filed June 17, 1904.

A motor is arranged to raise and lower the fireproof shutter.

776,238. Electric Switch and Signal Apparatus. Lawrence Griffith, Yonkers, N. Y. Original application filed November 28, 1903. Divided and this application filed October 18, 1904.

Electric apparatus for operating railway switches, signals and the like comprises an electric circuit, an electric switch in the circuit, a device for operating the switch and an electrically controlled locking device for automatically locking the switch-operating device against a complete return after it has been moved in either direction to energize the circuit. The locking device comprises a mechanical device operated by a single electric unit.



NO. 776,223.—VOLTAGE CONTROLLER.

776,278. Display Sign. Joseph Ward, Wellston, Ohio. Application filed July 23, 1904.

The sign is carried upon a vane upon the edges of which are mounted incandescent lamps, the circuit of which is alternately made and broken by a revoluble commutator device.

776,290. Device for Connecting and Disconnecting the Talking Circuits of Telephones. Addington L. Brincklé, Philadelphia, Pa. Application filed March 23, 1904.

A device for making and breaking the conversation circuit of a telephone comprises a member rotatably encircling the standard of a telephone instrument and adapted to be moved in the path of the receiver arm.

776,326. Multiple Attachment Plug. Harvey Hubbell, Bridgeport, Conn. Application filed February 26, 1903.

A multiple attachment plug comprises an insulating body having pairs of independent recesses, locking contact springs in the recesses, means for electrically connecting the body to an electrical fixture and caps having independent contact posts adapted to engage the locking contact springs, whereby a number of electric appliances may be placed in the circuit simultaneously.

776,337. Wireless Signaling System. Leonid Mandelstam, Berlin, and Hermann Brandes, Strassburg, Germany. Application filed September 8, 1904.

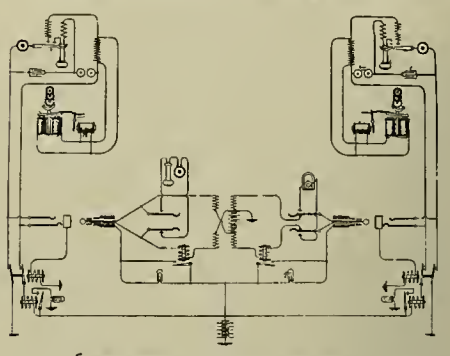
The invention embodies the arrangement of a transmitter and a receiver, the receiving circuit of which is loosely coupled with the aerial conductor and a detector, and a self-induction coil within the receiver circuit. The capacity of the latter is at least twice as large as the capacity of the detector with the object of diminishing the fluctuations of the capacity caused by the detector.

776,339. Electrical Cableway Conveyer. Charles Messick, Jr., Hackensack, N. J. Application filed September 7, 1904.

Electrically operated cableway conveyers or telphers comprise a frame, a motor carried by the frame, shafts also carried by the frame, grooved track wheels mounted to turn on the shafts, a gear connection between the wheels and the motor and a counterweighted downcome having longitudinal, pivotal, swaying relation to the frame and the motor.

776,359. Indicator for Electric Oscillations. Adolf Slaby, Charlottenburg, Germany. Application filed July 26, 1904.

A resonator in the form of a wire coil, one end of which is connected with a metal handle, is combined with fluorescent substances to which metal in finely divided form is applied at places of maximum potential.



NO. 776,429.—SERVICE METER FOR TELEPHONES.

776,374. System of Electrical Distribution. Bion J. Arnold, Chicago, Ill. Application filed December 17, 1901. Renewed January 8, 1904.

In a polyphase system of distribution are a polyphase source of current, transmission circuits supplied therefrom, a translating device, means for supplying the translating device with single-phase current from a circuit of the polyphase system to operate it, and means for supplying additional current of a different phase to the translating device.

776,380. Method of Producing Quick Electrical Oscillations of Different Phases. Ferdinand Braun, Strassburg, Germany. Application filed July 26, 1904.

Production of quick currents in phase difference is accomplished by oscillating elements, in which the electric energy is required to oscilate in phase difference excited by a common oscillating circuit, with which they are coupled either inductively or conductively with different strength.

776,429. Service Meter for Telephone Lines. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, Chicago, Ill. Application filed April 9, 1900.

Means at the central station apply currents of different character to the system. An actuating magnet is responsive to all such currents, a counting mechanism is associated therewith, and a blocking magnet is adapted to prevent the actuation of the counting mechanism, the blocking magnet being responsive to current of one kind only. (See cut.)

776,435. Telephone-exchange System. Edwin H. Smythe, Freeport, Ill., assignor to the Western Electric Company, Chicago, Ill. Application filed May 24, 1902.

Means for operating a switch which normally closes the plug circuit are adapted to be controlled by a magnet, and means actuated in the insertion of the plug bring the switch under the control of the magnet, whereby, upon the insertion of the plug in a spring jack, the electrical condition of the plug circuit will be made dependent upon the potential at the jack with which connection is made.

776,454. Rheostat. William Christensen, Philadelphia, Pa. Application filed August 24, 1903.

The essential features of the rheostat are a central core, a resistance arranged upon the core and comprising a single continuous strip spirally wound to form a series of coils, the portions of the strip between the coils being folded to provide intermediate connections between the coils, and means for cutting the coils into and out of an electric circuit.

EXPIRING PATENTS.

Following is a list of electrical patents (issued by the United States Patent Office) that expired on December 6, 1904:

374,173. Apparatus for Converting Heat Energy Into Electrical Energy. W. E. Case, Auburn, N. Y.
374,224. Incandescent Electric Lamp. M. Wheeler, Boston, Mass.
374,225. Electrical Dental Engine. G. W. Whitfield, Evanston, Ill.
374,236. Electric Railway. E. M. Bentley, New York, N. Y.
374,315. Conduit for Cable or Electric Railways. W. Nier, Kansas City, Mo.
374,329. Galvanic Battery. H. E. Waite, New York, N. Y.
374,348. Underground Conduit for Electrical Conductors. G. W. Cook, Detroit, Mich.
374,374. Electric Governor. W. H. Reynolds, Washington, D. C.
374,390. Telegraph Transmitter. A. Bixby, Baltimore, Md.
374,406. Regulation of Electric Generators. D. Higham, Philadelphia, Pa.
374,439. Transmitter. R. W. Whitney and F Pultz, Cleveland, Ohio.
374,444. Printing Telegraph. A. Bixby, Baltimore, Md.
374,456. Galvanic Battery. F. J. Crough, Eugene City, Ore.
374,458. Underground System of Electric Wires. J. P. Davis, New York, N. Y.
374,495. Coin-operated Induction Coil. W. R. Pope, Baltimore, Md.
374,528. Electric Gas Lighter. J. B. Entz, New York, N. Y.

WESTERN ELECTRICIAN

EVERY SATURDAY

Vol. XXXV. CHICAGO, DECEMBER 17, 1904 No. 25

LIBRARY OF ELECTRICAL ENGINEERING

Electrically Operated Bridge over North Branch of Chicago River.

An electrically operated double-bascule bridge of unusual size for its type has just been completed over the North Branch of the Chicago River at North Western Avenue. It is owned and operated by the city of Chicago and the details of its design were worked out by Mr. John Ericson, city engineer, and Mr. Thomas G. Pihlpeldt, bridge engineer. Figs. 1 and 2 show the bridge closed and open.

The following figures will give an idea of the general dimensions of the bridge: The structure contains three trusses, between which are located two roadways with street-railway tracks. Outside the trusses are two sidewalks. The roadways are each 18 feet in the clear and the sidewalks eight feet, giving a total width of about 55 feet. From center to center of pivots is 205 feet seven inches and from center to center of river piers 189 feet seven inches. Between the fenders (which are groups of piles driven in front of the piers to shield them from injury by the heavy boats) the distance is 168 feet. The bridge crossing is at an angle, so that the absolute clearance for navigation is 100 feet. The total length from abutment to abutment is 368 feet.

Fig. 1. Bridge Closed.

Fig. 2. Bridge Open.

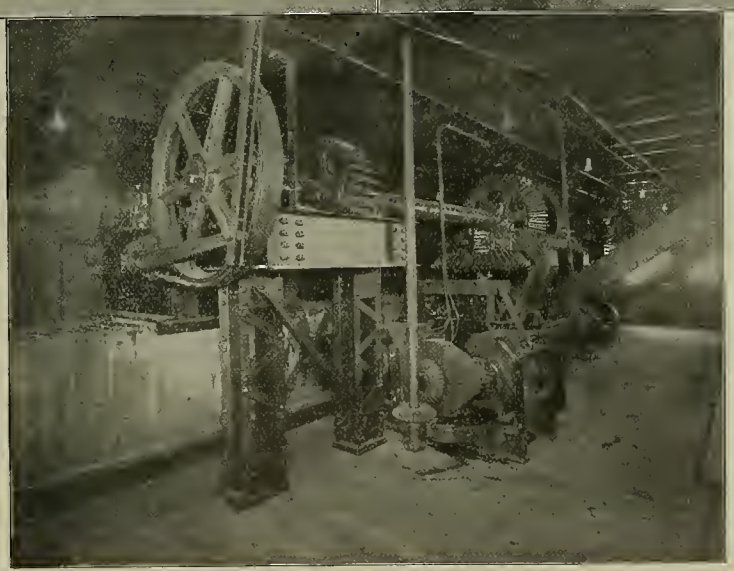


Fig. 3. View Showing Gearing and Motors.

ELECTRICALLY OPERATED BRIDGE OVER NORTH BRANCH OF CHICAGO RIVER.

Portland-cement concrete is used for the abutments and the amount required was 4,500 cubic yards. The curb walls for the approaches are of rubble masonry, and 3,000 cubic yards was necessary for this part of the work. The superstructure is of steel and iron, aggregating in weight 1,090 tons. The counterweights are made of pig and cast iron and weigh 700 tons. The total weight of the machinery is 100 tons.

The two halves of the bridge are entirely independent of each other, there being a bridge tender at each end, who, from his little house situated on the pier, shown in Figs. 1 and 2, has entire control of his half from a switchboard in the house, everything being controlled electrically, including the motors for raising and lowering the bridge, motor-driven pump for drawing out the water which collects in the counterweight pits, the signals and the motors which operate the locking bolts which hold the two parts of the bridge together when down.

With such heavy moving parts and to counteract the enormous wind pressure which is developed on the under side of the bridge when raised, as will be readily appreciated by glancing at Fig. 2, machinery and gearing of great rigidity and strength are required, and this is located in compartments back of and beneath the bridge next to the abutments.

Fig. 4 on the next page shows the arrangement of the principal gearing, to the left being a plan and on the right an elevation showing the manner in which the gears mesh with the bridge chords. The installations at the two ends of the bridge are identical. Fig. 3 is an interior picture taken at the left end of the bridge as shown in Fig. 1. As seen in Fig. 3, there are two motors used, which are of the direct-current street-railway type and of 50 horsepower each. The armature shaft of each motor is connected through an intermediate gear to a horizontal shaft bearing worms which intermesh with two horizontal worm-wheels which are not indicated in either the picture or the diagram. The worm-wheels transmit their energy through vertical shafts to the vertical gears shown, and these in turn rotate a shafting running crosswise of the bridge and bearing three heavy pinions so situated as to mesh with gear teeth which are placed on the peripheries of the circular parts of the bridge chords. These are not ordinary toothed gears, but are pins fitted crosswise between the two parallel members of each chord of the bridge and are perfectly open so that snow and ice do not collect and clog the gearing.

The worm gear gives great power and a reliable control of the movement of the bridge, the motors being able to lift the bridge and sustain it in any desired position. It is said that the bridge might be lifted and sustained against a wind blowing at 80 miles an hour, indicated velocity.

The actual power required to raise and lower the bridge under ordinary circumstances is really very small as compared with the capacity of the motors installed, it being only about six to 11 horsepower for each half of the bridge. Still conditions may obtain at some time with a high wind blowing when a much larger amount will be required.

A powerful hand brake is provided which may be used if desired in lowering the bridge and is operated by a hand lever in the operator's house.

When the two halves of the bridge are closed they are locked by bolts which slide from one half and fit into corresponding recesses in the other half. The bolts are operated by a small electric motor which may be controlled from the switchboard in the bridgetender's house, as already mentioned. From the switchboard the signal lights and the lights in the motor room may also be controlled. Power is taken from the lines of the Chicago Union Traction Company at 500 volts.

The bridge is calculated to bear an equally distributed load of 100 pounds per square foot on the roadways and sidewalks and will also carry the heaviest street cars (22 tons empty and 35 tons fully loaded) and steam rollers.

C. L. Strobel of Chicago was the contractor on this work and G. P. Nichols & Bro. the sub-contractors on the electrical work.

Bombay Electric-light Plant.

Further particulars of the Bombay electrical generating station, referred to in the Western Electrician of August 27th last, are given in the Indian Electrical, Mechanical and Textile News. The plant comprises one 300-kilowatt 5,500-volt three-phase engine-driven alternator and one 500-kilowatt 5,500-volt three-phase turbo-alternator, which are excited by two 100-kilowatt directly coupled dynamos. The frequency is 50 cycles per second. The 300-kilowatt set is coupled to a Brush engine and runs at 333 revolutions per minute when supplied with steam at 150 pounds, superheated by 150° F. It is to be capable of dealing for short times with an overload of from 10 to 15 per cent. and to work either condensing or non-condensing. The cylinders are 16½ inches and 23 inches diameter, respectively, by 10½-inch stroke. It is specified that the speed is to keep within 2½ per cent. up or down, and all bearings have forced lubrication, the oil being cooled by passing through a coil placed in running water. The 300-kilowatt alternator has a stationary armature and revolving multipolar field and is to be capable of running in parallel with the turbo set. Carbon brushes running on phosphor-bronze collecting rings are employed. The turbo set runs at 3,000 revolutions per minute and is of the Brush-Parsons parallel-flow multifold-expansion type, using steam through the full range from boiler pressure to the vacuum. There is a by-pass to allow of high-pressure steam being admitted to the low-pressure portion for large overloads. The lubrication is by two motor-driven three-throw oil pumps, each capable of supplying oil to all the bearings of three such sets. The armature is stationary with form wound coils and the field winding is in slots in the laminated revolving field.

American Society of Mechanical Engineers.

The fiftieth half-yearly meeting of the American Society of Mechanical Engineers was held at New York on December 6th to 10th. The number of members and guests registered was 625.

On Tuesday evening, December 6th, Mr. Ambrose Swasey of Cleveland, Ohio, delivered his presidential address on "Some Refinements of Mechanical Science," the full text of which is printed elsewhere in this issue. Afterward Mr. Charles Wallace Hunt of New York unveiled a portrait of John E. Sweet, who served as president in 1883-4, and whose presence on the platform was greeted with applause. Mr. Hunt referred to the progress achieved by the society since its establishment 25 years ago and of the efforts made in 1879 by Professor Sweet to organize the society.

On Wednesday morning the annual business meeting was held, and the president-elect, John R. Freeman of Providence, R. I., was welcomed. The long printed report of the council dealt mainly with routine matters. The library committee reported as to the arrangements made for the amalgamation of the society's library with those of the electrical and mining engineering societies in the new Union Engineering Building to be provided largely by the generosity of Andrew Carnegie. It is estimated that the maintenance of the joint library will cost each society $4,000 annually. Mr. C. W. Hunt reported that the plans for the new building were well advanced and that they were hoping to overcome legal obstacles so that the new building would be exempt from taxation. Colonel H. C. Meyer, Jr., of New York, made a verbal report on the government coal-testing plant at St. Louis, which is to be temporarily continued until Congress sees fit to make an appropriation for its permanent establishment. So far 180 loads of different kinds of coal have been tested in typical boilers.

The society now numbers 2,801 members of all classes, of whom 162 have been elected under the presidency of Mr. Swasey. The year's income was $41,520 and the expenditure $42,170.

The first professional paper, "A New Hydraulic Experiment," was presented by A. F. Nagle of Buffalo, N. Y. The author gave a formula to determine the rise of water in a standpipe fed from a long distance when the draft suddenly ceases. This formula is that the rise in the standpipe in feet above the level of the reservoir is equal to the square root of the length of the pipe multiplied by the velocity multiplied by 0.176. Sir Benjamin Baker contributed a written discussion on this paper, the secretary saying that this was the first time that they had received a written discussion from an English member.

William W. Bird and Howard B. Fairfield of Worcester, Mass., presented a paper on their twist-drill dynamometer, giving diagrams relating to feed and angle. They recommended a change of angle for drills for ordinary work from the present 59 degrees to 45 degrees.

Gus C. Henning of New York read a paper on "Diamond Tools," and produced a number of specimens of diamond drills and a drilled die for drawing platinum wire for incandescent lamps where it is necessary to have the wire perfectly smooth in order to fuse into the globe. This die was of 0.00125 inch diameter. Very fine wires are produced by consecutive reduction. Diamond tools, he said, although expensive, are economical in use. A die will last eight years without the least sign of wear and one of 0.004 caliber has drawn 550,000 pounds of soft copper wire.

At the session on Tuesday evening a paper on "Centrifugal Fans" by August J. Bowie, Jr., of San Francisco, Cal., was presented in abstract. Mr. Bowie analyzed the loss of energy due to sudden changes of conditions and suggested remedies.

Charles T. Main of Boston, Mass, presented a paper on the computation of the commercial value of waterpowers and the determination of damages for diverted flows. The economical development of waterpower depends upon a number of factors and with the necessary data the value of power can be expressed in horsepower per annum and compared with the cost of steam power with coal at various prices.

C. E. Sargent of Chicago, Ill., forwarded a paper on an indicating steam meter. He described "a simple, cheap and fairly accurate device," which, he says, will indicate steam pressure under varying conditions of load and supply.

Robert S. Hale of Boston, Mass., discussed rules and formulas for staybolts, braces and flat surfaces in boilers. He thought that many bulges in boiler plates were due to overheating and that there was no call for change in design. G. R. Henderson of New York said that in the case of locomotives the water was driven away from the sheet and caused the bolts to be weakened by overheating.

The chief paper of the evening was on "Condensers for Turbines," read by George I. Rockwood, which mainly dealt with a 400-kilowatt Westinghouse-Parsons steam turbine installed recently at the Atlantic Mills, Providence, R. I., where injector condensers are used. The writer's conclusions were warmly contested. F. P. Perry of Allston, Mass., endorsed Mr. Rockwood's views, mainly on account of the high cost and large size of surface condensers. F. M. Wheeler of New York defended the surface condensers, but wished they had "rubber necks." Henry H. Supplee mentioned that Mr. Parsons in England had used an injector to help out the surface condenser. Replying to this discussion, Mr. Rockwood said that his joints were particularly tight and he did not recommend the practice of doping leaks.

On Wednesday morning Charles H. Benjamin of Cleveland, Ohio, read a paper "On the Bursting of Four-foot Flywheels." His first wheel, having six arms and weighing 194 pounds, had a theoretical bursting speed of 1,920 revolutions per minute, but it actually burst at 1,100 when the calculated centrifugal force of the balance weight was 2,760 pounds. A second wheel burst at about 600 revolutions per minute when the centrifugal force of the flanges on one side was about 1,680 pounds and the linear speed of the rim about 125 feet a second. A third wheel, 49 inches in diameter, 6¾ inches rim, 1⅛ inches thick, weighed about 900 pounds. It was built in 10 segments of cast steel with 20 arms of phosphor bronze and reinforced by diagonal braces. This wheel was designed by a Baltimore firm as a model for a proposed 30-foot flywheel. After being driven at 1,650 revolutions per minute it showed minute fractures and very slight opening of the joints. On increasing the speed to 1,755 the wheel burst and projected parts of the rim 200 feet away. The rim speed at the time of the explosion was 372 feet per second, or more than 250 miles an hour, and the tensile stress due to centrifugal force was 13,800 pounds per square inch. The experiment showed among other things that the joints were much weaker than the solid rim. G. R. Stetson of the New Bedford (Mass.) Edison Lighting Company thought that large wheels sometimes broke on account of the metal expanding by heating, and mentioned a wheel with a wooden rim which obviated this trouble.

The secretary presented in abstract a paper by Sanford A. Moss of West Lynn, Mass., "On the Influence of the Connecting Rod on Engine Forces." This was purely a mathematical contribution and was not discussed.

The secretary also presented in abstract a theoretical paper by James B. Stanwood of Cincinnati, Ohio, "On Losses in Non-condensing Engines," based on an extension of the experimental methods of Mr. Willans. The paper analyzed condensation and expansion losses and gave a diagram of adiabatic curves for varying mean effective pressures.

S. H. Bunnell of Watertown, N. Y., read a paper on "The Power Plant of the Tall Office Building." Such plants must develop widely varying powers at unexpected times, as, for instance, when all the elevators of the building happen to be taking their maximum current. F. H. Ball of Bound Brook, N. J., said that the purport of the paper was to demonstrate that compound engines are less efficient than the four-valve type with light loads.

The last paper on Thursday morning was the work of A. Borsody and R. Campbell Cairncross and was read by Prof. C. E. Lucke of Columbia College. He described an ingenious method of measuring temperature in steam nozzles by means of movable thermal couples. These experiments, said Prof. F. R. Hutton, were leading toward a possible solution of the problem of the gas turbine.

On Thursday afternoon the members accepted the

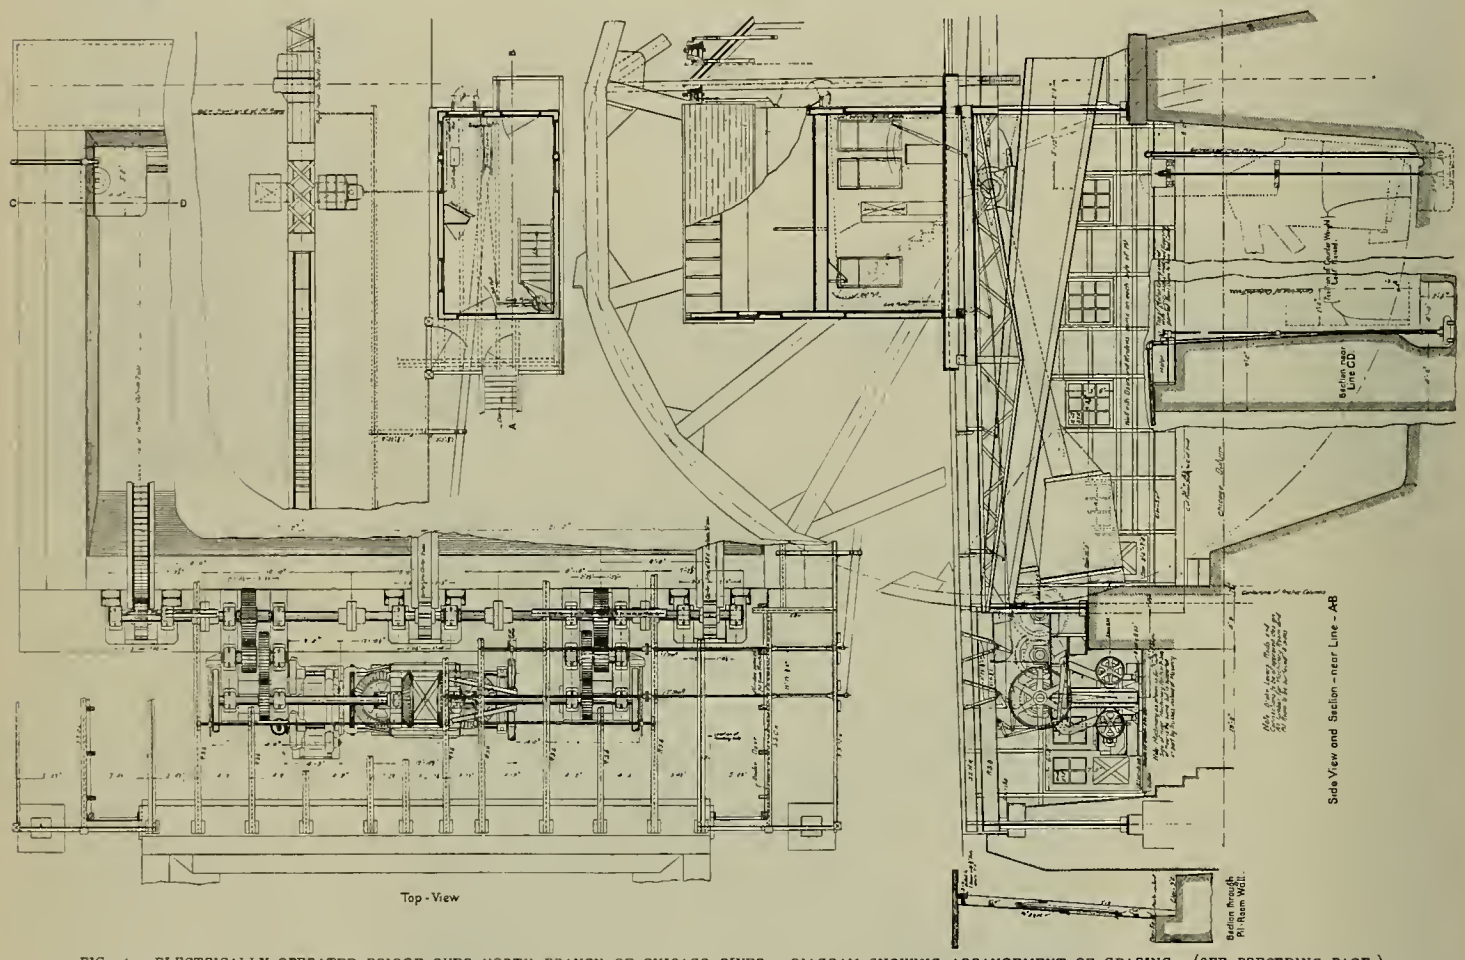

FIG. 4. ELECTRICALLY OPERATED BRIDGE OVER NORTH BRANCH OF CHICAGO RIVER.—DIAGRAM SHOWING ARRANGEMENT OF GEARING. (SEE PRECEDING PAGE.)

invitation to inspect the power house of the New York subway and also saw the new steam turbines at the Edison company's Thirty-ninth Street station. Thursday evening was devoted to a reception at Sherry's restaurant, where Mr. and Mrs. Ambrose Swasey and Mr. and Mrs. J. R. Freeman received a large company. A dance and supper followed.

On Friday morning at the closing session the society received an appendix to the report of December, 1901, on the standardization of engines and dynamos. The appendix was signed by James B. Stanwood (chairman), W. M. McFarland, A. L. Rohrer, Frank Ball and W. B. Forbes and read as follows: "To facilitate pressing the armature upon the engine shaft, the engine builder should reduce the diameter of the shaft beyond the armature fit an amount of not less than 0.006 inch." A preliminary report was also received as to a suggested standard tonnage basis for refrigeration.

G. B. Henderson read a paper on "Fuel Consumption of Locomotives." He presented a diagram from which to calculate both theoretically and practically the fuel consumption in pounds at any mileage from five to 40 and at varying tractive forces and gradients. It was possible to determine the best conditions under which to work a locomotive, and this was not always at maximum speed and load. A lively discussion followed. Mr. A. Cary gave details of recent coal-consumption tests made by the Delaware and Lackawanna railroad, where 30 pounds of coal for each square foot of grate surface was consumed, the coal being a mixture of soft and bituminous. The discussion turned to the subject of having two firemen on a locomotive, which several speakers advocated for large modern locomotives; others calling for a mechanical locomotive stoker. Mr. Henderson said that the tendency was for firemen to have more muscle and less brain, so that hereafter firemen would not so readily develop into engineers.

E. A. Hitchcock of Columbus, Ohio, read a paper in abstract on "Road Tests of Brooks Passenger Locomotives" on the Hocking Valley railroad between Columbus and Toledo. In these tests the unaccountable losses and radiation was reduced to about three per cent. In the ensuing discussion the use of dry pulverized coal in locomotives was not endorsed.

A. Bement of Chicago, Ill., read a paper on the "Discharge of Water with Steam from Water-tube Boilers." He found that with a peculiar form of baffle the evil was partly remedied. Mr. Bement also read a paper on the determination of the efficiency of steam-generating apparatus.

The last paper was by Mr. F. W. Dean of Boston, who dealt with the "Forcing Capacity of Fire-tube Boilers," which type he thought was fully equal to all demands and could not be surpassed by the water-tube form.

Among those present, in addition to those mentioned, were John W. Lieb, Jr., New York; John J. Hopper, Springfield, Ohio; Henry Vogt, Louisville, Ky.; H. L. Whittemore, Milwaukee, Wis.; H. M. Norris, Cincinnati, Ohio; C. J. H. Woodbury, Lynn, Mass.; Sidney Hosmer, Boston; James I. Ayer, Boston; George H. Barrus, Boston; William W. Estes, Providence, R. I.; C. M. Russell, Massillon, Ohio; George S. Searing, Chicago, Ill.; S. T. Wellman, Cleveland, Ohio; W. M. Allen, Cleveland, Ohio; Alex Dow, Detroit, Mich.; Charles W. Naylor, Chicago, Ill.; Henry M. Lane, Cleveland, Ohio; W. B. Bogardus, Jackson, Mich.; G. A. Buvinger, Dayton, Ohio; Paul R. Brooks, Chicago, Ill.; Henry Marx, Cincinnati, Ohio; Jason D. Miles, Miles City, Mont.; John Fritz, Bethlehem, Pa.; Charles F. Hart, Brooklyn; Louis R. Alberger, New York; F. A. C. Perrine, Pittsfield, Mass.; George E. Fisher, Natick, Mass.; Mrs. Ambrose Swasey, Cleveland, Ohio; George M. Brill, Chicago; Oliver S. Shantz, Chicago; G. E. Merryweather, Cleveland, Ohio; Mrs. Samuel A. Parr, Denver, Colo.; Daniel H. Jones, Ampere, N. J.; N. H. Doane, Cincinnati, Ohio; R. Raymond, Brooklyn; Ernest Lee Jahncke, New Orleans, La.; William M. Taylor, Indianapolis, Ind.; L. A. Cupp, Monterey, Mexico; Francis Hodgkinson, East Pittsburg, Pa.; Charles H. Little, Cleveland, Ohio; Robert I. Clegg, Cleveland, Ohio; L. S. Louer, Chicago; C. A. Gates, Massillon, Ohio; H. M. Sage, Chicago; Will J. Sando, Milwaukee, Wis., and H. G. Reist, Schenectady, N. Y.

Proposed Subway System for Chicago.

It is altogether likely that the city of Chicago within a few years will be the possessor of a comprehensive subway system which will provide adequate space for at least two street-railway tracks and for water, gas, sewer and electric pipes as well. Such a subway might contain loops for one North Side street-railway line, two West Side lines and three South Side lines. Differing plans and estimates of cost for the subway work have already been presented in the form of reports to the local transportation committee of the City Council by Mr. Bion J. Arnold and Mr. George W. Jackson, consulting engineers. The following notes upon one plan for the proposed work are taken from the second and more comprehensive of Mr. Jackson's reports.

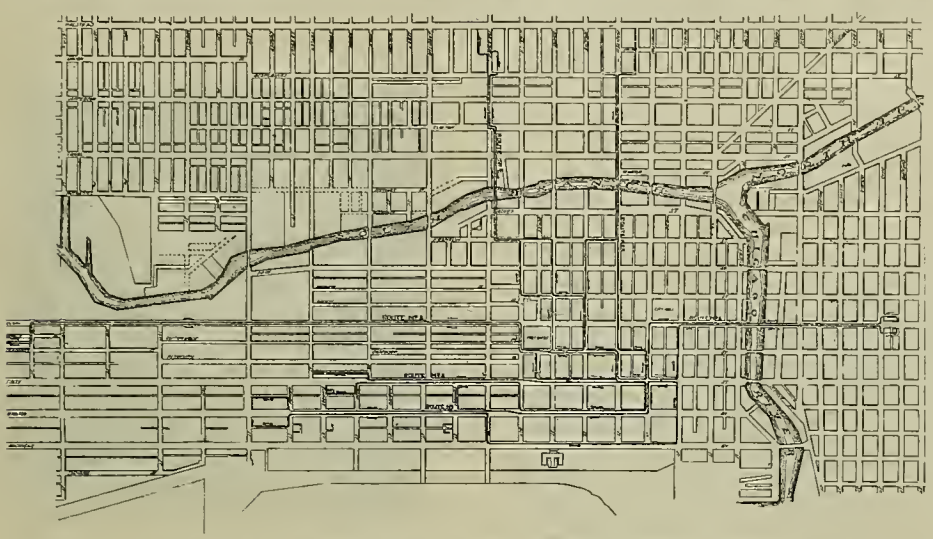

FIG. 1. PLAT OF CENTRAL BUSINESS PORTION OF CHICAGO SHOWING ROUTES OF PROPOSED SUBWAY.

Fig. 1 is a plat of Chicago lying between Chicago Avenue on the north, Eighteenth Street on the south, Halsted Street on the west and the lake on the east. It shows the six different routes of the proposed subway, the arrows pointing in the direction the street cars are to travel.

By the use of such a subway it will be possible for a passenger to pay his fare at any station and on entering the subway take any car he may desire, or a passenger riding from one part of the city on entering the subway can step from one car to a car going to any other part of the city without paying another fare or using a transfer.

The plan, as shown in Fig. 1, will do away with the grade crossings, as all cars would be going in one continuous direction, and in no case would two loops cross each other. This alone would cut down the possibility of an accident to the minimum, as the majority of street-car accidents now occur at the so-called grade crossings, or where two lines cross each other at right angles.

Under this plan additional transportation facilities may be provided for any particular section of the city the committee may desire. Any number of additional connections with the downtown section of the subway can be built for the actual cost of construction to meet the needs of the different divisions of the city. For instance, if the committee desires to provide more adequate facilities for the populous north and northwest sections of the city, a subway could be built under the river at Franklin Street and at Lake Street and connected with the main subway loops at Clark and Washington Streets and at Madison and La Salle Streets. The main loops in the downtown district may be regarded as the basic foundation for a comprehensive subway system which will meet the city's needs for all time by increasing the number of inlets and outlets to the different divisions of the city from time to time as the public necessity demands.

Fig. 2 is a typical cross-section of the Jackson subway for double-track purposes. Spaces (1) and (3) are reserved for the city's use and are each to be nine feet wide by 13 feet six inches high and are to contain the city's high-pressure and other waterpipes, storm-water drainage, fire and burglar-alarm and light service and all corporations' pipes, cables and underground work.

Spaces marked (2) are to be reserved for distributing all service pipes and electric wires into buildings and also to permit of the crossing of the city's and corporations' pipes and wires at right angles and at a street intersection.

The space for the street cars, including a 10-foot walk between tracks and running the whole length of the subway, will be 60 feet. The walk will enable passengers alighting from the cars to go underground to any station they desire and will also allow of the cars stopping at any desired points, thus reducing the possibility of congestion. On the stretch of single track on Wabash Avenue there will be a platform on each side of the track.

Spaces (5) are unobstructed spaces beneath the surface walks.

The estimated costs of construction for the six routes is as follows: Route No. 1, $2,776,197; route No. 2, $1,997,473; route No. 3, $4,071,453; route No. 4, $2,393,546; route No. 5, $2,476,807; route No. 6, $1,894,721. This gives a total of $15,610,197. To this is added the price of purchased property, $1,250,000; engineering and omnibus expenses, seven per cent. of the total, $1,092,713, and incidental expenses, labor, insurance, accidents and possible damages, four per cent., $624,407, giving a grand total of $18,577,317.

"In estimating the cost of the construction of the different cross-sections of the subways," says Mr. Jackson in the conclusion of this interesting report, "I have taken into consideration the construction of stations for the entrance and exit of passengers, stations to be placed not to exceed 450 feet apart, as well as the repaving of the streets and the construction of a practical underground conduit system for trolley purposes as shown on drawing No. 10 [Fig. 1], the placing of the different corporation pipes and cables which now occupy space in the streets in which subway would be constructed, as well as taking care of the city's present utilities and including the building of a new sub-soil and storm-water system and high-pressure waterpipe systems, all of which is covered in the above estimates. In conclusion I beg leave to say that in my judgment the construction of the 50,703 lineal feet of subway and all of the necessary appurtenances can, with the proper executive ability, be completed in 30 months' time without discommoding the general public to any great extent."

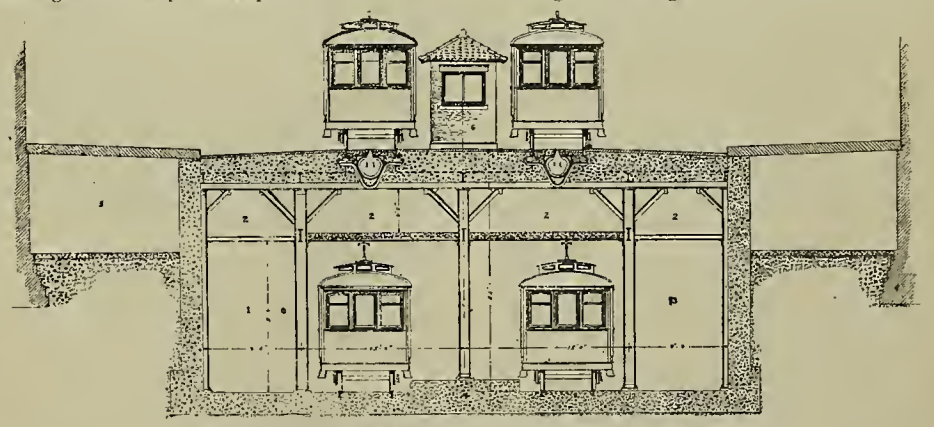

FIG. 2. TYPICAL CROSS-SECTION OF PROPOSED CHICAGO SUBWAY.

The National Electric Light Association has just issued a report on thawing water pipes by electricity. This report is compiled by Mr. George S. Haley of Rutland, Vt., and comprises data received from 75 different companies which have had experience in this direction.

Liquid-contact Voltage Regulator.

Some circuits in which the fluctuations in the voltage and current are very marked—such, for instance, as those used in car-axle lighting systems, street-car headlights, storage-battery charging circuits, depending upon central-station municipal sources of current and the like—require a voltage regulator of more than ordinary range and reliability. Numerous and ingenious contrivances have been invented for controlling or governing the presence and introduction of resistance in such circuits for the purpose of maintaining a constant current or electromotive force upon the supplied circuit. These devices are generally characterized by a row or series of resistance terminals or contacts and a collector, sweep, or contact finger or arm, which is automatically actuated by mechanical means under magnetic control. An invention designed to provide

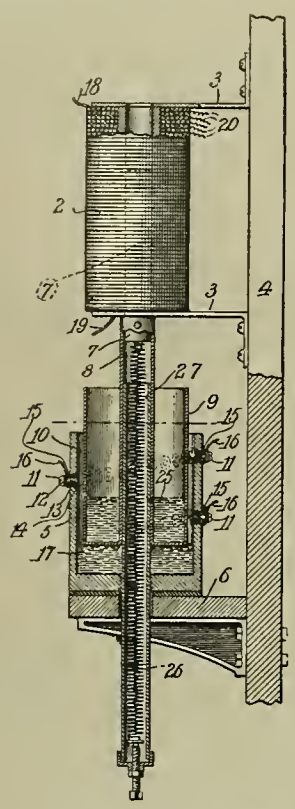

FIG. 1. LIQUID-CONTACT VOLTAGE REGULATOR.—VERTICAL SECTION.

an electric controlier or regulator that shall admit of the subdivision of the resistance to any extent desired or required by the service to be performed by the translating devices in circuit has been recently patented by Mr. Alexander McGary of LaGrange, Ill.

The chief difficulties encountered in the present controllers or regulators, according to Mr. McGary, arise from the employment of a rigid collector brush or sweep in combination with rigid resistance sections or contacts. These elements make it necessary, he says, to employ complex auto-driven mechanical elements that are short lived, the efficiency of which varies with surrounding conditions, which are comparatively slow in operation and which offer a varying frictional and mechanical opposition to quick, accurate movement in place of the uniform forces and conditions which the problem demands. Proceeding on this assumption the inventor determined upon the elimination of the usual rigid or solid metal sweep as well as all of the mechanical and auxiliary electrical and electromagnetic elements and members, and in place has adopted a liquid current collector for co-operation with the necessary resistance-coil terminals or contacts with a simple electromagnetic device for actuating and controlling the movement of the "liquid current collector."

The invention, broadly considered, consists of a liquid container or receptacle having, preferably in its walls, the requisite number of resistance terminals or contacts, suitably insulated and arranged at different points or elevations. A fluid, liquid, or plastic substance, preferably mercury, in the receptacle, co-operates with a liquid-displacing device that is electromagnetically operated or controlled and which by its movement causes the liquid to rise or fall into contact with higher or lower terminals, as the case may be, the liquid being included in the electric circuit and having a suitable terminal in either container.

Fig. 1 is a vertical section of an automatic electric regulator embodying the invention. As shown in the diagram, (2) represents a solenoid, supported by brackets. The measuring-pot or liquid-container (5) is supported upon but insulated from the bracket (6). The pot is preferably arranged beneath the solenoid and contains a central guide or standard (27).

The solenoid core (7) has on its lower end a tubular extension (8) to slide upon the standard (27). The extension carries the displacing device or plunger (9), which is preferably a hollow cup of less diameter than the pot or container, a narrow annular space (10) being left between the plunger and the inner walls of the pot.

The resistance terminals are designated by (11) and are placed close together in an inclined or spiral row, stepping upward from the bottom of the pot to the top. The pot-walls thus accommodate a large number of resistance-coil terminals within a small space measured vertically, and it is obvious that this construction permits the use of as many terminals as may be required for nice regulation by the fine subdivision of the resistance. The difference between the elevations of adjacent terminals or contacts may be as slight or as great as differing conditions require, yet with entire freedom from the usual difficulties pertaining to contact areas and insulation.

The pot is partially filled with a liquid, preferably mercury, which is a good conductor, and when the plunger falls or is depressed it displaces the mercury and drives it upward between the plunger and the walls of the pot or container, forcing the mercury into contact with the exposed or contact ends of the resistance terminals. When the plunger is raised the column of mercury falls and is thus withdrawn from contact with one or all of the terminals, according to the height to which the plunger is lifted.

It will be noted in Fig. 2 that the greatest displacement of the mercury in the pot occurs at the time when there is the least resistance in circuit and that the solenoid has less weight to raise at the beginning of the stroke of the core than after it is partially elevated. The force of the solenoid, however, increases as the core enters it and its increased effectiveness is usually sufficient to compensate for the increased weight of the plunger when lifted. However, it may be preferable to increase arbitrarily the strength of the solenoid as the plunger is lifted

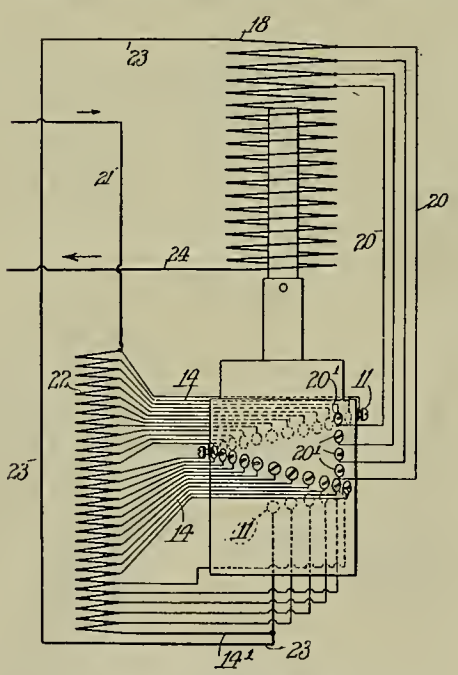

FIG. 2. LIQUID-CONTACT VOLTAGE REGULATOR.—DIAGRAM OF CONNECTIONS.

and to this end auxiliary solenoid windings (2') are employed, formed by tapping the coils of the solenoid at different heights. The taps (20) lead to auxiliary terminals (20'), provided in the wall of the pot and at different elevations. The lowest tap (20) leads to the uppermost terminal (20') and the upper tap leads to the lower terminal (20'). The result of these connections is that when the mercury is elevated in the pot the upper coils of the solenoid will be practically short-circuited or weakened by being thrown into multiple arrangement, while upon the elevation of the plunger and when the solenoid needs assistance the terminals (20'), one or all, will be bared by the fall of the mercury, thereby restoring the corresponding coils to active series circuit in the solenoid to further compensate for the increased weight that must be lifted and sustained by the solenoid.

The Latest form of "Handbook" Telephone.

Ever since the enforcement of the law against the operations of race-track bookmakers in Chicago the police department has been obliged to keep constantly on the alert to circumvent the numerous and ingenious schemes which have been devised for obtaining race-track news to be used for gambling purposes. The telephone has been used repeatedly for this purpose, but owing to the strict surveillance of the police department with the co-operation of the Chicago Telephone Company the gamblers are finding it harder and harder to conceal the telephone connections at the gambling resorts.

Perhaps the latest piece of apparatus for this purpose is the one shown in the accompanying picture, which was discovered recently in a West Madison

THE LATEST FORM OF "HANDBOOK" TELEPHONE.

Street resort by Assistant Police Chief Schuettler's gambling detail. The outfit consists of an ordinary suit case, in which are contained two complete subscribers' telephone sets with three or four cells of dry battery neatly strapped in one corner, the whole just filling the case when packed in a certain position. The two instruments are in multiple and terminate in a short flexible cord conductor carrying a plug. On the under side of a table in the gambling place were sockets or jacks to fit the plugs, and the sockets were in turn connected by concealed tap wires to a line of the telephone system.

The operator of this curious telephone set would stroll into the place and when the way was clear would place the suit case on the table, throwing it open with the instruments ready at hand. A moment sufficed to insert the plug, when the two telephones were ready for business. At the moment an alarm was given, however, the plug would be jerked from its socket, the instruments replaced and all that remained was a very innocent-looking and somewhat dilapidated suit case. The picture is reproduced herewith by the courtesy of the Chicago Daily News.

Central-station Accident in Chicago.

An accident to the Chicago Edison Company's system which, but for the prompt and efficient methods pursued by the company, might have led to serious trouble in the downtown district, occurred on the afternoon of December 12th between 4:30 and 5:15 p. m. At about half past four the lights in the downtown district, which are fed from the network by the Harrison Street station, began to grow dim, and in some parts, especially along State Street, where the load is the most concentrated, almost died out, causing some alarm among the many shoppers who were in the stores at that hour. The trouble did not last long, however, and by 5:30 p. m. the lights were all burning as brightly as usual.

Mr. Louis A. Ferguson, second vice-president of the Chicago Edison Company, made the following statement in relation to the matter:

"The trouble was at the Harrison Street station and was caused by the breaking of the main feed-water line, which interrupted the supply of water to the boilers and at the same time filled the entire power house with escaping steam, rendering it impossible to get near enough to the seat of the trouble to immediately ascertain its exact nature. This trouble, coming as it did, just as the load was increasing to the evening maximum, and the necessity of banking the fires and cooling off the furnaces made it impossible after the break was repaired to raise the steam again quickly enough for this power house to hold its share of the heavy supply which is required throughout the city in the late afternoon in winter. Fortunately no one was injured by the

escaping steam and hot water. The only sections of the city affected by this trouble were those that were supplied from the Harrison Street power house. There was no trouble at the Fisk Street steam-turbine power house."

As fast as possible after the break occurred the load was transferred to the steam-turbine plant of the Fisk Street station, which, although well loaded before, carried the additional load thrown upon it as fast as it could be transferred.

The storage batteries, of which there are 15 connected to the network, rose to the occasion and by their combined output made matters very much less serious than they would have been. They kept the lamps in certain localities near the batteries lighted during the whole time, though the enormous loads at parts farther away caused such a drop that the batteries were not able to keep all the lamps burning.

The Next Convention of the National Electric Light Association.

By John Craig Hammond.

Business men, railroad men and central-station men of the entire West have joined hands to welcome and entertain the delegates to the convention of the National Electric Light Association, which will be held in Denver next June some time in the first full week.

Last month the electrical men met in the offices of the Denver Gas and Electric Company to discuss with Ernest H. Davis of Williamsport, Pa., president of the national association, the subject of holding the meeting in a western city. Denver and Colorado Springs were most prominent in the competition for the convention. Officers of the Colorado Springs Chamber of Commerce and central-station men from that city announced that $5,000 had been pledged for the entertainment of the convention if their city was chosen as the place of meeting. That put the Denver men on their mettle and they said that more than this sum could be obtained from the commercial bodies and business men of their city. A hot contest was in sight, because those in the meeting took sides with one or the other of the competing cities. Then came a compromise.

It was agreed that Denver should have the convention—the business sessions—and that Colorado Springs should have the whole convention for two or three days to entertain the delegates and show them the city, show them its prospects. Then other cities were heard from through the men who wish to see them progress. Many of these will entertain small parties of delegates. Mr. Davis was pleased. He returned to the East. Then he wrote to Henry L. Doherty, president of the Denver company, asking him to act as the representative of the association in the West, to take charge of the arrangements. Mr. Doherty invited the business men, the railroad men and the central-station men to meet with him. They assembled in Denver on November 28th, more than a hundred of them. Those who could not come, wrote, pledging their support.

The business men told those assembled that they were ready to give generous support. Commercial organizations of Denver and other cities in Colorado pledged their support. The railroad men said that low rates could be considered as granted, though still lower tariffs might be obtained from the rate-making board later. They said that one fare from Chicago, St. Louis and points in their territory was a certainty, with a fare and one-third from points farther east to these cities. The hotel men said that charges would not be increased and that special efforts would be made to care for the delegates and visitors.

One of those present suggested that the attendance might be reduced because of the distance of Denver. His statement was met very promptly with the answer that the natural growth of the association would be the first offset to a decrease from the attendance at Boston, where the last convention was held. Then the point was brought out that there is something new to offer the delegates in the West—new kinds of plants; that is, new to most of the members of the association; new ways of using electricity peculiar to the country, and opportunities for new plants. The desire of everyone to see a portion of the country not before visited was set forth as another strong factor.

Then Mr. Doherty informed the meeting that he knew that the members of the association would be entertained better than they had ever been; that he had received assurances of co-operation that made this certain, and finished by saying that not less than $7 would be spent on every person in attendance in Denver alone. As the final action of this general entertainment committee Mr. Doherty and two others were empowered to nominate the active committees and to arrange for further meetings of the general body and the smaller groups of men.

Following is the membership of the general committee:

Orson Adams, Grand Junction Electric and Gas Company, Grand Junction, Colo.; William Mayher, Greeley Power and Light Company, Greeley, Colo.; W. E. Renshaw, Seaton Mountain Electric Light, Heat and Power Company, Idaho Springs, Colo.; F. C. Webber, Leadville Gas and Electric Company, Leadville, Colo.; P. N. Nunn, Telluride Power Company, Telluride, Colo.; R. S. Campbell, Utah Light and Railway Company, Salt Lake City, Utah; John Martin, California Gas and Electric Company, San Francisco; A. Pollock, San Francisco Gas and Electric Company; F. E. Warren, Cheyenne Fuel and Power Company, Cheyenne, Wyo.; C. F. Brown, Roaring Fork Electric Light and Power Company, Aspen Colo.; William T. Wallace, Colorado Electric Power Company, Canon City, Colo.; Herman Webber, La Bella Electric Company, Cripple Creek, Colo.; C. H. Peters, Durango Light and Power Company, Durango, Colo.; George B. Tripp, Colorado Springs Electric Company, Colorado Springs, Colo.; Charles Neely, Fremont Electric Light Company, Florence, Colo.; M. T. Morrill, electric light company, Golden, Colo.; F. P. Dewey, electric light company, Georgetown, Colo.; Gen. Fred. Walsen, electric light company, Idaho Springs, Colo.; H. R. Wray, Chamber of Commerce, Colorado Springs, Colo.; J. F. Vaile, electric light company, Pueblo, Colo.; E. J. Temple, electric light company, Boulder, Colo.; D. O. Freyberger, electric light company, Loveland, Colo.; John Doss, electric light company, Ouray, Colo.; C. Y. Breck, Telluride Electric Light and Power Company, Telluride, Colo.; Nelson Rhoades, Arapahoe Electric Light and Power Company, Littleton, Colo.; W. F. Jones, Gold Belt Consolidated Electric Company, Victor, Colo.; J. B. Wiggenhorn, Florence and Cripple Creek Railroad Company, Cripple Creek, Colo.; G. E. Sethman, Meeker Light, Heat and Power Company; C. W. Badgley, Crested Butte Light and Water Company.

Gen. Irving Hale, General Electric Company; O. B. Kohl, Lacombe Electric Company; John Brannan, Lacombe Electric Company; J. H. Waters, La Bella Electric Company; S. W. Cantrill, Denver Tramway Company; J. A. Beeler, Denver Tramway Company; T. B. Stearns, Stearns-Rogers Manufacturing Company; Maj. S. K. Hooper, Denver and Rio Grande Railway; J. F. Vallery, Burlington Route; W. E. Bridgman, H. J. Mayham Investment Company; E. R. Griffin, Union Pacific Railroad; C. L. Wellington, Colorado and Southern Railroad; D. H. Hoops, Chicago and Northwestern Railroad; G. W. Vallery, Colorado Midland Railway; H. B. Kooser, Missouri Pacific Railway; W. J. Jones, Denver, Northwestern and Pacific Railway; Charles B. Sloat, Rock Island Railway; J. P. Hall, Santa Fe Railroad; D. C. MacWatters, Cripple Creek Short Line; Fred H. Bostwick, Hendrie & Boltboff; J. C. Poole, Stanley Electric Company; H. L. Woolfenden, Gilbert Wilkes & Co.; R. D. Marthens, Nernst Lamp Co.; Mayor R. W. Speer, E. S. Kassler, Montrose Electric Light and Power Company; J. J. Cooper and J. W. Stearns, Mountain Electric Company; Edward C. Means, Adams-Bagnall Electric Company; Edward Pool, American Steel and Wire Company; J. D. Jackson, Western Electric Company; W. P. Carstarphen, Carstarphen Electric Company; H. W. Lawrence, New England Electric Company; P. J. Brown, General Electric Company; R. E. Miller, Crocker-Wheeler Company; Charles S. Onderdonk, Onderdonk Manufacturing Company; R. B. Sullivan, Frank W. Frueauff, Henry L. Doherty, C. W. Humphrey, W. J. Barker, E. T. Sayer, C. N. Stannard, Rufe Gentry, John Craig Hammond, J. Charles Andrews, Denver Gas and Electric Company; William Maher, Albany Hotel; A. R. Hall, Capital Lamp Company; C. H. Speers, Colorado Midland Railroad; J. F. Callbreath, J. S. Temple and Arthur Williams, Chamber of Commerce; J. J. Hernan and N. M. Tahor, Hotel Men's Association; Armour C. Anderson and John McNamara, Real Estate Exchange; J. J. Joslin, George Gano, Merchants' Protective Association; W. S. Iliff, C. K. Durbin, G. W. Cook, James Williams, Thomas Smith, J. J. Henry, B. K. Sweney, all of Denver.

Following are the committees as announced by the three men chosen to select members:

Executive—Henry L. Doherty, chairman; F. W. Frueauff, vice-chairman; G. B. Tripp, H. R. Wray, J. A. Beeler, T. B. Stearns, J. F. Callbreath, Armour C. Anderson, Gen. Fred Walsen.

Transportation—George W. Cook, chairman; J. S. Temple, Major S. K. Hooper, J. F. Vallery, E. R. Griffin, H. R. Wray, C. L. Wellington, George F. Porter.

Finance—George W. Gano, chairman; George B. Tripp, vice-chairman; Gen. Irving Hale, J. W. Stearns, C. K. Durbin, J. A. Beeler, J. J. Hernan, J. F. Callbreath, Armour C. Anderson, Gen. Fred Walsen, John Craig Hammond, G. W. Cook, J. H. Waters.

Entertainment—Philip Cross, chairman; F. W. Frueauff, W. E. Bridgman, T. B. Stearns, G. W. Vallery, G. B. Tripp, H. R. Wray, R. W. Speer, Gen. Fred Walsen.

Hotels—W. J. Barker, chairman; J. J. Hernan, J. J. Cooper, J. F. Vaile, S. W. Cantrill, H. L. Woolfenden, Philip Cross.

Advertising—John Craig Hammond, chairman; John McNamara, T. E. Fisher, S. K. Hooper, J. F. Vallery, N. M. Tabor, D. H. Hoops, J. J. Joslin, D. C. MacWaters, Charles B. Sloat.

Colorado Springs—George B. Tripp and H. R. Wray.

J. Charles Andrews is secretary of all committees. His address is care the Denver Gas and Electric Company, 405 Seventeenth Street, Denver.

GROUP OF MEMBERS OF GENERAL COMMITTEE IN CHARGE OF ENTERTAINMENT OF NATIONAL ELECTRIC LIGHT ASSOCIATION.

San Francisco Street-railway Service to be Operated by Current from Long-distance Transmission.

It has been decided by the officials of the United Railroads of San Francisco to do away with the local generating plants and utilize the power of the California Gas and Electric Corporation for the operation of all its various electric lines. According to the contract just signed by the United Railroads and the power company, the latter will furnish and deliver to the railroad sub-stations sufficient power for all of its purposes, thus permitting the shutting down of the present generating plants. The new arrangement will be in force January 1, 1906. The power will be generated at the various power stations of the California Gas and Electric Corporation in the Sierras and brought to San Francisco over long-distance transmission lines.

The power needed for the operation of the lines lying north of Market Street and between the bay and the ocean, including the park and ocean line south of Golden Gate Park, will be delivered to and distributed from the sub-station at Turk and Fillmore Streets. The current necessary to operate the north end of the San Mateo line, the Ingleside line and part of the Mission Street line will be delivered at the Geneva Avenue sub-station. The power for the operation of the southern end of the San Mateo line will be distributed from the Millbrae sub-station. The present large direct-current generator station at Bryant and Alameda streets will be converted into a sub-station to care for the territory now supplied by it. It has not been decided yet what disposition will be made of the rest of the local power houses.

To prevent any interruption in the service through damage to the long transmission lines, the California Gas and Electric Corporation will establish a gas-engine plant capable of generating the required current on short notice. The California Gas and Electric Corporation now owns seven waterpower stations in various parts of the Sierra Mountains. Electra station in Amador County has a capacity of 20,000 kilowatts. The De Sabla in Butte County is capable of developing 14,000 kilowatts, and Colgate in Yuba County develops 9,420 kilowatts. Four other stations have a combined capacity of 7,400 kilowatts.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the **old address** as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own.* THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

REMITTANCES.—All checks, drafts and other remittances should be made payable to the order of the publishers, the **Electrician Publishing Company,** and addressed to the offices of publication, Suite 510, Marquette Building (204 Dearborn Street), Chicago, Illinois, U. S. A.

DATES AHEAD.

Northwestern Electrical Association (annual convention), Hotel Pfister, Milwaukee, Wis., January 18 and 19, 1905.

Ohio Independent Telephone Association, Columbus, Ohio, March, 1905.

National Electric Light Association (annual convention), Denver, June 6th, 7th and 8th, and Colorado Springs, June 9th, 10th and 11th.

THE NEXT telephone convention is likely to be held by the two Independent associations, the Interstate and the National, united. At the convention of the Interstate association in Chicago this week a committee was appointed to confer with a similar one from the National association, with full power to act, to make arrangements for the consolidation of the two associations. Such arrangements having been perfected, it is understood that the joint committee is to name the time and place of the next convention and that it be a joint meeting of the two bodies. Another important feature of the convention just closed was the action taken toward gaining an entrance for the Independent long-distance telephone systems into Chicago, to connect with the automatic system now in operation in the city. This is an important matter to all Independent operators, and its accomplishment, which seems probable, will mark an epoch in the evolution of long-distance Independent telephony. The convention just closed was a success, although a controversy between many of the Independent manufacturers and one or two of the officers of the association made the exhibits of apparatus few in number. The attendance was good, probably 250 representatives of operating companies being present. The members were manifestly eager for information concerning the proper methods of managing, constructing and operating exchanges, and this may suggest to those having charge of future conventions the wisdom of a good number of technical papers. A strong list of officers was chosen to lead the association in the carrying out of the consolidation proceedings, a move which Mr. Barnhart and Mr. Coleman, the retiring president and secretary, have worked hard to accomplish.

IF THE daily newspapers are well informed—and sometimes they are—there is now more substance than ever before to the hope that the University of Chicago will establish a school of engineering. The prospect is still rather hazy, but somebody seems to have told somebody else that it was a pretty shrewd guess that Mr. Rockefeller had given Dr. Harper a matter of two or three million dollars—charmingly indefinite, this anticipatory talk of large money donations!—to establish such a school. So the hope is still but a hope, although projects such as this often have a mysterious way of becoming imperfectly known in advance of official announcement. It is to be hoped that this is the fact in this case.

Chicago, with its large population and populous contiguous territory, should easily sustain another engineering school of the first class. In the past there has been talk of the affiliation of the strong and useful Armour Institute of Technology with the university as its engineering school, but speculation of this character has not been rife of late. At any rate, two schools would be better than one. In the matter of education, technical and otherwise, one must not regard institutions engaged in the same line of work as competitive in the sense that grocery stores on adjacent street corners are competitive. The emulation should be on the high basis of mighty striving for the diffusion of knowledge, that the community, the nation, and finally the world may be benefited. In a country like ours and in the present age, manual and technical training is of the greatest importance in all grades from the kindergarten to the university. No great university in America can be an educational center of the first rank, well rounded, without an engineering school. Engineering is the art of doing things on scientific principles. Americans pride themselves on their practical facility for doing things. They are demanding the best scientific training to supplement their native ability. Recognizing this situation, as it must, the University of Chicago cannot much longer defer the establishment of its engineering department.

ELECTROCHEMISTRY is not only one of the most interesting of the fields of industrial endeavor into which electricity enters, but it is also one of the most important. Sir Joseph Swan, regarded in England as one of the "grand old men" of the electrical profession, illustrated this when he was asked not long ago by an interviewer for the official organ of the Faraday Society of London what he considered to be the most important and valuable of the applications of electrochemistry. Very naturally Sir Joseph answered that the largest of such applications is undoubtedly copper refining. Which is the most important it is difficult to say; many processes are competing for the honor of that distinction Among the numerous applications of electrochemistry to metallurgy, perhaps the most important after copper refining is that which has brought within easy reach of the public what 50 years ago was in the popular sense a new and rare metal—aluminum. Few realize how the aluminum industry has grown or the point it has reached at the present time, when there is electrically produced and used for an immense variety of purposes between 10 and 20 tons of aluminum every day. Fifty years ago aluminum was equal in cost to silver. It now competes in point of economy with copper. "You alluded to the application of electricity to the alkali and chlorine manufacture," added Dr. Swan. "These are very important branches of the electrochemical industry, and no doubt susceptible of development, but it must be remembered that that is restricted by a limited demand. In close relationship to this is the largely extended manufacture of sodium, due to the employment of the electrolytic method. Then we must not forget the manufacture of calcium carbide."

Thus a cursory survey of the spread of electrochemical processes shows the great value of these methods, which are, while comparatively new, yet quite old in principle, for the origin of electrochemistry is traced to Volta. Especially where power is cheap and plentiful, as in the vicinity of waterpowers, do these processes flourish, and it cannot be doubted that the development of electrochemistry is destined to show still greater triumphs.

AS TRANSMISSION lines become longer and voltages higher the question naturally arises, What is the maximum distance to which power may be transmitted on a commercial basis? Primarily, of course, there are two factors which in the broadest sense will determine this question. These are the cost of power at the generating station and the price that can be obtained at point of delivery. The difference between these two elements must cover the cost of transmission, the interest on investment and the profit. In a general way it appears that the annual cost per kilowatt for transmitting power may be continually reduced by increasing the amount of power transmitted, in all directions except the cost per kilowatt due to line conductors, which cannot be reduced. The limiting distance, therefore, will depend, finally, upon the cost of line conductors and upon that alone. In a paper prepared for the next meeting of the American Institute of Electrical Engineers, Mr. Ralph D. Mershon, an engineer particularly well qualified to discuss the subject, has brought out this fact plainly and then, after making a number of assumptions which seem to be fairly taken, he has arrived at a series of general equations expressing the relations between the distance of transmission and the quantities which govern it. By inserting in these equations various coefficients as to the purchase price and selling price a series of curves has been drawn, and from these some interesting conclusions may be derived.

The maximum amount of power dealt with in the paper is 500,000 kilowatts, probably too high to be seriously dealt with at the present time. However, 200,000 to 300,000 kilowatts is within the range of immediate possibility, and it would probably require a net revenue of 12 per cent., not alone for dividends, but also as a protection to bonds. Under these conditions the limiting distance may be taken at 550 miles. It also appears that the voltage will be fixed, not by atmospheric losses, but by economic conditions. The author has gone about his work in a very capable and thorough manner, and the various factors which are used in deducing the equations which he has arrived at as the basis of his conclusions seem to have taken into consideration every element which can effect the final results. The paper is valuable in itself and should bring out a good discussion.

INTERSTATE INDEPENDENT TELEPHONE ASSOCIATION.

The fourth annual convention of the Interstate Independent Telephone Association of America was called to order in the banquet hall of the Auditorium Hotel, Chicago, on December 13th at 2:30 p. m., with President Henry A. Barnhart of Rochester, Ind., in the chair. The attendance was the largest of any opening session of any previous meeting of the association, and there were many new faces, as well as more familiar ones, indicating a lively interest in the proceedings to follow. There was a notable absence of exhibits at the convention, only a few of the manufacturers and supply men making a display of apparatus.

Before taking up the regular programme which had been prepared, President Barnhart asked if anyone had anything of a preliminary nature which should be taken up. E. M. Coleman of Louisville, Ky., secretary of the association, responded with a suggestion that the chairman appoint three members to serve as a credentials committee and to assist the secretary, in accordance with a resolution passed at the last convention of the association, which provides that admission to the sessions of the association be by properly approved credentials. This committee, as appointed, consisted of Walter Matthews of Maysville, Ky., P. C. Holdoegle of Rockwell City, Iowa, and William J. Fee of Milford, Ohio. Mr. Holdoegle moved that, for obvious reasons, the word "executive" be inserted before the word "sessions" in that part of the resolution passed at the last convention relating to credentials, and which reads as follows: "Resolved, That at future conventions no one be admitted to the sessions of the association except upon presentation to a regularly appointed doorkeeper of a certificate bearing the indorsement of the company or firm he represents and further indorsed by the secretary of the association." The motion prevailed.

President Barnhart then delivered the annual address of the president. He spoke clearly and with a dignity befitting the office he holds.

President Barnhart's Address (Abstract).

In an address before our convention of one year ago the importance of our having connection with Chicago and Chicago with our multiplied thousands of enterprising telephone subscribers was urged, applauded by the convention and approved by the press and people of the city. But the conditions of isolation stand precisely the same today and the imperativeness of this mutual need is more pressing than ever before. We have St. Louis, Minneapolis, St. Paul, Cincinnati, Louisville, Indianapolis, Cleveland, Toledo and Detroit. Why can't we have Chicago connections and thereby bridge the last chasm in the Central West which bars perfection in convenience and efficiency in long-distance telephone service?

The fixed programme for the daily sessions of this convention is before you and in its pages you will observe that topics vital to our business welfare and to the welfare of the telephone-using public are listed and assigned to men of broad intelligence and practical experience for presentation and to you, sirs, for effective consideration. Some of these have to do with the theory and practice of successful telephone endeavor; some invite consideration of the law and the liberty of our vocation; some suggest the duty of operator to public and public to operator; some will point out the needs of broader and better facilities for handling our business at home and abroad; and most important of all, some raise the danger signal against marching, heedlessly, into future embarrassment and ultimate trouble by trusting manufacturers who would betray us to the enemy for a mess of pottage.

A great railroad system in this country once asked the public for a suggestion of a forceful warning to travelers who crossed the right-of-way in jeopardy of passing trains. Many answers were received, but on one the management unanimously agreed. It was, "Stop; look; listen." Have you thought of such precaution in the heavy and constant investments you are making in the Independent telephone field? If you have not and are traveling heedlessly toward the Bell Telephone Company's audacious and selfish right-of-way, I beseech you to "stop, look and listen." The very life of our existence in a most commendable and promising enterprise may depend upon our discretion in the matter of guarding well against the machinations and deceptive intrigues of a business competitor that has shown us no consideration other than intimidation and arrogant and destructive competition.

We may survive as Independents by buying Bell-made apparatus and by subscribing and paying for Independent telephone periodicals which publish page after page of Bell advertisements and covertly put Bell arguments; but that we are constantly strengthening the enemy by doing so must be so plain that a wayfaring man, though a fool, would readily distinguish the folly and the danger of doing so. It is said that he that seeth and believeth not shall be damned (or words to that effect), and he ought to be (figuratively speaking) if he is an Independent operator who depends on Independent connections, Independent support and Independent protection and then gives his patronage and the destiny of his business to the Bell company.

Gentlemen, we are here for business, and we have tried to arrange our programme so you will not only have full opportunity to participate in the deliberations and conclusions of the convention, but you may, here in comfort, have ample time to examine apparatus and supplies, make new acquaintances, renew old ones and profit not only by what you hear but what you see.

Following the applause which greeted the president's address, E. M. Coleman read his report as secretary of the organization.

Secretary Coleman's Report (Abstract).

It is only necessary to repeat briefly the salient points mentioned or discussed in the official report of 1903, namely: the three distinct lines of attack instituted and deeply laid plans to be carried out by the Bell Telephone Company in its attempt to break down all competition, and thus again give the octopus full sway in its unwarranted oppression of the public, to wit:

1. By securing control of Independent telephone-operating companies, or the one which serves as the center of a cluster of operating companies, thereby destroying the efficiency of the whole cluster.

2. The attempt to enter and control the long-distance business of this country, thus placing the operating companies and the public at their mercy.

3. And last, but not least, the deepest-laid plot of them all—the one which would be easiest to carry into effect and which would cost the Bell company far less money in the aggregate than either of the two schemes mentioned above—and that is to secure the controlling influence, or power to dominate or manipulate, the Independent manufacturing interests in this country.

The advisability or wisdom of trying to conceal, or hide, or cover up, the conditions that exist and the events that have transpired that affect your personal interest as well as your organized interest since your last annual convention is not apparent to those who have been in touch with what has transpired.

The first law of nature, as well as the highest law of man, is self-preservation and self-protection, and there can be no legitimate reason why official lips should be closed and silence be the watchword when the facts are so apparent and the effects so potent relative to your own business interests, and especially when your competitor knows all too well.

Again, official position, responsibilities and obligation demand that you should know the exact status of affairs calculated to affect your own business, and official duty is not performed when facts are withheld that do affect your business, especially if the tendency is to do hurt.

It is presumed that no man connected with this organization, either in the capacity of a representative, delegate or official, has any inclination, much less is it the choice of anyone to enter into any contention, struggle, fight or warfare against the interests of anyone else in any line of activity connected with the Independent movement, yet it is due you to know and it becomes my obligation to tell you that certain manufacturing concerns in this country undertook more than a year ago to devise ways and means by which this organization should be demoralized or its effectiveness as an organization should be destroyed.

Your last convention demonstrated that their attempt at the meeting of 1903 was a failure, but in due time the same or similar schemes looking to the same end were again instituted on a broader scale to the extent that those who seemed so specifically interested in an attempt to destroy your organization branched out in due time in the inauguration of a regular, systematic boycott; therefore opened up correspondence with the various manufacturing concerns and supply houses in this country, using their personal influence in an effort to prevent those concerns located outside of Chicago from making exhibits at this convention, their plan being that if they could keep the manufacturers and supply houses from making exhibits at this convention they would so cripple the convention financially that ultimate annihilation and disintegration would be the result, and hence their designs accomplished.

Isn't it a strange picture, isn't it a paradoxical proposition for you to undertake to comprehend, how it is and why it is that certain manufacturing interests should undertake to demoralize and destroy your organization in the United States? The organization of the very people from whom they get all their revenues, to whom they must sell all their products, and from whom they have realized their vast profits?

These brief statements and suggestions are made simply that you may be brought to a point to stop, and think, and to appreciate properly the attitude in which you are placed, and duly contemplate what the future may possibly have in store for you and your business and your investments.

So determined have certain parties been in their deeply laid plans to thwart the purposes of your organization that secret conferences and meetings have repeatedly been held, devising ways and means by which this organization could be killed.

Let this report speak plainly and boldly, because your money is at stake and the obligation of an official is to point out to you just the conditions that exist right now in your own channels of business.

It is a lamentable condition if the time has come when the official of an organization of this character cannot perform his functions as such and cannot carry out your instructions as an organization without being condemned and criticised and persecuted because he undertakes the performance of the duties and powers delegated to him by you when in annual convention assembled.

But, to more pleasing matters to be considered. The growth of the Independent movement in this country is already phenomenal. Today the Independent people of this country have over 3,000,000 telephones in service, while the Bell people only claim 1,270,000. Your toll-line systems are being rapidly built and extended all over this country until soon a complete network will bless every town and city with connection with the outside world.

In round numbers 140,000 pieces of literature have been mailed out from the secretary's headquarters during the convention year 1904.

The pressing demands upon the official secretary have been so great until the plan of reorganization mapped out by your special committee during the year becomes absolutely essential for the proper conduct of your organized business.

And the financial burden of taking care of the expenses from one convention to another becomes rather heavy.

You will admit the necessity of a reorganized plan when you are made aware of the fact that it costs your secretary out of his own pocket from $800 to $1,500 per year to defray the necessary expenses of your association. This burden, under the old plan of organization rested upon him, and upon his efforts principally in making the next succeeding convention a success, could any assurance be based for the replenishing of his depleted private exchequer.

Traffic arrangements of great importance between a number of strong, Independent long-distance companies have been entered into and such steps inaugurated as will prove of great benefit to the Independent movement in this country.

Some of your officials and committeemen have devoted much of their time during the past 12 months in an effort to execute your will, and in traveling over the various states, perhaps 14 in number, thus getting in contact with the operators in their own field of action, profound and lasting impressions have been made as to existing conditions.

There is a growing sentiment among the Independent operators in this country that cannot be checked, that cannot be hindered, that cannot be weakened, that cannot be smothered. And that sentiment is thoroughly grounded and sufficiently based on the conviction that they, as Independent operators, deserve the right of self-protection and self-preservation, and that surely there is some practical plan by which such protection may be had and the perpetuity and permanency of the business be thus placed beyond any question.

But you must realize and you evidently do appreciate the fact from your own experience and observation in your own home localities, where you have to contend with the Bell company, that the question of rates is no longer the basis of competition, because the Bell company has cut its rates all over this country and in nearly every locality to a figure as low, and in many instances much lower, than the rates charged by the Independents, and you are bound to see that in the near future competition will not be based upon rates at all.

No man who really thinks and has the logical mind with which to analyze conditions and therefore is able to read the future by the history of the past, can doubt for one moment the truthfulness of the statement that the competition in the future between the Independents and Bell company will be based entirely upon the efficiency of the service rendered.

This, as every other index finger in the Independent telephone movement, at present points to the absolute necessity beyond all question or quibbling to the adoption of a uniform standard apparatus, and this cannot be accomplished by any man or little coterie of men simply because they may be possessed of a large amount of capital, but it must be the expressed wish and determination and decision and by the action of the organized operators in this country. You, and you alone, can lay the permanent foundation upon which can safely rest the great fabric or superstructure of your business in the future.

In the name of all reason, common sense, practical judgment and business experience, is it not the proper thing for you to take such action as will certainly, surely, effectively and permanently cement you together? This can only be accomplished by a common financial interest or joint investment, because such a condition alone can successfully bind together the thousands interested in the varied, intricate questions involved in the prosecution of any great business enterprise.

Committee Reports.

Committee reports were then called for. George N. Bandy of Des Moines, Iowa, chairman of the express committee, stated that the principal grievances which Independent operators had experienced with the express companies had been largely removed within the last year, and for this reason he did not think it necessary to make a long report. He said that most express offices were now using Independent instruments and paying the regular rental.

L. L. C. Brooks of Minneapolis, Minn., chairman

of the committee on Postmaster-general Payne's order, as it was named last year, had sent in a long report, but as he could not be present at the opening session, it was held over to be read upon his arrival. Charles E. Hull of Salem, Ill., ex-president of the association, stated that the special committee on uniformity of equipment and standardization of apparatus had not completed its report, and he was given further time.

PLAN CONSOLIDATION WITH THE NATIONAL ASSOCIATION.

Secretary Coleman laid before the association an outline of the deliberations of a joint conference of representatives of the Interstate association and the National Independent Telephone Association, held in Chicago, on November 18th, which had for its object the consolidation of the two associations. He said that the actions of the conference were unofficial, the meeting having been called by individuals who had no authority from their association, but who were willing to bear the responsibility, believing that the members of both organizations would favor a comprehensive plan for closer relationship.

Those present at the meeting on November 18th were Henry A. Barnhart of Rochester, Ind., Charles E. Hull of Salem, Ill., and E. M. Coleman of Louisville, Ky., representing the Interstate association, and J. B. Hoge of Cleveland, Ohio, J. G. Splain of Pittsburg, Pa., and Ed. L. Barber of Toledo, Ohio, representing the National association. Mr. Coleman at the conference submitted a long statement in which he said that this was the third attempt in which he had been instrumental in trying to bring about a consolidation. He expressed the belief that his association would favor the move. Mr. Hoge, for the National body, submitted a statement pointing out the urgent need of consolidation and the trend of the times toward organization. He outlined at length the necessity of standardization and united effort and said that this could be accomplished better by one organization than by two. After reviewing the situation at length, and drawing an expression of willingness for a union from both sides, a resolution was adopted at the conference in November to the effect that each association appoint a committee of five men, "and that these 10 men shall be empowered to effect a permanent organization by a union of the two associations in question. And this committee of 10 shall determine when another convention of Independent operators shall be held, which shall be a joint meeting of the two associations under the plan that may be adopted by the 10 men constituting the joint conference mentioned above, the object of which shall be the ratification of the work of the joint committee provided for in this agreement."

Turning from the consideration of this subject, the Interstate association accepted an invitation from the American Steel and Wire Company inviting the members of the association to go to Waukegan on Thursday, by special train, to inspect the plant of the company at that place. On motion of C. E. Hull the convention then adjourned, to reconvene in executive session in 20 minutes.

At the executive session a resolution was offered by C. E. Hull, as follows: "Resolved, That the chairman of the association appoint a committee of five, himself included, to meet a like committee from the National, to consider ways and means to consolidate, with power to act, and with the proviso that the membership of this association be continued in the consolidated association with all their present rights and privileges."

An animated discussion followed the presentation of this resolution, on the point of who should constitute the committee. Those entering the discussion were George N. Bandy of Des Moines, Iowa, Secretary Coleman, C. E. Hull, President Barnhart, J. S. Bellamy of Knoxville, Iowa, and A. B. Conklin of Aurora, Ill., treasurer of the association. These gentlemen became eloquent at times, especially Colonel Coleman, in commenting on the good work for the association performed by President Barnhart. After considering a number of amendments to the resolution, it was finally passed, amended so as to include on the consolidation committee President Barnhart, the president to be elected, the secretary to be elected, and two men to be chosen by Mr. Barnhart. The session then adjourned for the day.

Wednesday's Proceedings.

READING AND DISCUSSION OF PAPERS.

The second day's session of the convention was opened at 2:45 p. m. on Wednesday and was devoted to the reading and discussion of papers. The severe illness of O. M. Bake of Hamilton, Ohio, prevented his presence, and his paper on "Why Independent Telephone Securities do not Command the Market Price They Deserve According to Their Earning Capacity," was not read. Several members expressed disappointment at not hearing this paper. In response to an inquiry as to the best way to secure financial backing for Independent telephone systems, Mr. B. F. Wasson said the money should be raised at home. Create an interest in your enterprise, put in good instruments and apparatus with durable construction, and then with good service local capital will support you. The speaker created a ripple of laughter when he said that some years ago he borrowed $50,000 from his friends and started what is now one of the large Independent exchanges in Illinois. But recently, he said, he organized a stock company, issued bonds, and from the sale of these he is now engaged in paying his friends back.

"What Independent Telephone Companies Owe the Public; What the Public Owes the Independent Telephone Companies," was the subject of a paper read by Theodore Thorward of South Bend, Ind. The author said that the Bell company no longer has a monopoly on telephone apparatus, and is now on the same footing with the Independent companies. The people have a right to demand of those receiving franchises that the field be developed. Public sympathy for the "home telephone" will not last long if the service is not kept up to date. Toll-line connections are also due the patrons; although Mr. Thorward did not believe that the public expected the local companies to give long-distance service from New York to San Francisco at once. He said that 97 per cent. of telephone subscribers never use such service and 75 per cent. never talk over toll lines at all. However, the neighboring counties of a local system should be connected. The lines should be constructed of 25-foot, six-inch top cedar poles, 35 to a mile, standard toll-line crossarms, with a No. 10 metallic circuit, copper if possible, transposed every half mile.

Speaking of connecting with large cities, Mr. Thorward said that the Illinois Telephone and Telegraph Company (now controlled by the Chicago Subway Company), operating the automatic system in Chicago, claiming to be an Independent company, owed it to Chicago and the surrounding Independent companies that it connect with the surrounding systems and thereby make Independent entrance into Chicago possible. The speaker said that 90 per cent. of the people appreciate good service and are willing to pay a good rate for it. If the public and the companies deal fairly with each other, he predicted exceptional prosperity for Independent systems the coming year.

The paper was freely discussed. A. B. Conklin of Aurora, Ill., in response to an inquiry by Mr. Preston of Iowa as to the possibility of connecting with the automatic system in Chicago, said that his company, the Interstate Independent Telephone Company, whose fine system of 75,000 telephones centers in Aurora, had been negotiating with President Wheeler of the Illinois company for more than a year for Chicago connections, but had not yet received a satisfactory answer. Mr. Conklin's company had offered to dig a tunnel from the city limits to the tunnels of the automatic system if Mr. Wheeler would secure the permit from the city. Mr. Conklin believes that as soon as the Chicago Automatic company has disposed of some important matters in connection with reorganization, etc., the Independents will receive consideration and in all probability get the desired connection with the automatic system in Chicago.

Others who entered into the discussion of the Thorward paper were R. M. Richmond of Evansville, Wis., W. G. Thompson of Lebanon, Ohio, F. S. Mosher of Sandwich, Ill., Richard Valentine of Janesville, Wis., P. C. Holdoegle, W. M. Hazeltine, J. G. Glass of Pekin, Ill., B. F. Wasson and others.

E. D. Graham of Mexico, Mo., then read an interesting paper on "Manufacturers' Duties and Their Dues." Mr. Graham thought that the operators of exchanges should stand by the Independent manufacturers who have given them apparatus of such quality as to be able to compete with the Bell systems. He said that efficiency in service was fast becoming the basis of patronage. He also thought that manufacturers should in turn protect their customers. "If all of the manufacturers had recognized the importance of performing their duties toward the operator and had loyally and faithfully performed them," he said, "they would have gotten their just dues in addition to the vast amount of money they have received as profits on their business. They would today have had the loyal support, confidence and backing of all operators in the Independent field."

On motion of H. C. Barbour of Ottawa, Ill., the chairman appointed a committee to confer with the Chicago Subway Company relative to its attitude toward giving Independent connections into Chicago, and, if possible, get a written statement from President Wheeler. The committee as appointed was composed of Mr. Barbour, A. J. Vernier of Kankakee, Ill., and Theodore Thorward.

In the absence of J. H. James of Mankato, Minn., his paper on "Uniformity of Equipment and Standardization of Apparatus the Imperative Demand in the Operating Feld," was read by John E. Jones of Jonesboro, Ark. Mr. James reviewed the history of telephony, including the important patent litigation, up to the present, at which time he thinks the instruments and equipment of the better class of Independent exchange is far superior to that of their competitor. His paper was a long one and was a strong plea for standardization of equipment and uniformity of construction. This, he said, with corresponding wisdom in business affairs, was the solution of the long-distance problem of the Independents.

J. S. Bellamy, a large owner of Independent exchanges in Iowa, did not believe in standardization. He said that standardization means the death of improvement. All the Independent men want, he said, is the best there is made. W. G. Thompson of Ohio was of the same opinion as Mr. Bellamy. F. W. Ellis spoke at length in favor of standardization.

Following the discussion of papers and several announcements by the president, the convention adjourned until nine o'clock on Thursday morning.

Thursday's Proceedings.

Thursday's session was opened at 9:30 a. m. The chairman appointed a nominating committee composed of Lichty of Iowa, Graham of Missouri, Hull of Illinois, Matthews of Kentucky, Harper of Wisconsin, Fee of Ohio and Reeves of Indiana.

The paper of O. M. Bake on Independent telephone securities was read by title and discussed. W. G. Thompson said that to float successfully telephone securities, financiers must be educated to the importance, value and need of the Independent exchanges. The company must first secure credit among its friends. G. I. Miller of Boone, Iowa, also discussed the paper.

Rome C. Stephenson of Rochester, Ind., read an instructive paper on "How Avoid Personal Injury and Responsibility in Telephone Construction Work and Maintenance." He spoke of the duty of companies to use appliances of the best make and use reasonable precaution in construction. Many deaths to employes are caused by contact with telephone wires which have become charged by close proximity to electric-light and power wires. The duty of lighting and power companies to use precaution was also outlined and their liability in accidents caused by such contact was shown. He advised constructing telephone wires four feet above the light wires, where they must be close together, and that guard wire be used. Messrs. Stanton, Johnson and Thompson threw light upon the subject in discussing the paper.

The committee which had been appointed to visit A. G. Wheeler of the Chicago automatic telephone company relative to a possible connection of the automatic telephone system in Chicago with Independent telephone systems outside, reported. Mr. Wheeler, the committee said, gave the impression that his company would at any time within three months be ready to consider a proposition from any reliable authority to connect with any system of good construction and equipment. He was willing to build to the city limits to connect, but would probably not sign a contract until a satisfactory test could be made to try any connection effected.

R. F. Johnson of Saginaw, Mich., thought that Mr. Wheeler should state what he considered good, standard construction, and said that his own idea was 40 poles to the mile—25-foot six-inch—and No. 10 copper circuits for all business.

The committee was instructed to continue its conferences with Mr. Wheeler and secure from him a signed agreement to connect with the Independents. A. B. Conklin of Aurora, whose company would probably be the first to connect with Chicago, was added to the committee.

The report of L. L. C. Brooks of Minneapolis, chairman of the committee appointed a year ago to investigate the order from the postmaster-general that only the telephones of one system—Bell or Independent—be used in postoffices, was read by the secretary. The report stated that a strong effort had been made in Washington to secure legislation favorable to the Independents, but nothing has yet been accomplished, except that the order was modified and no Independent telephones have been removed recently. The report recommended a committee selected by the association, one from each state, to push this matter with the government.

The report of the treasurer was read, showing that all money had been expended. Secretary Coleman said that he had spent about $1,200 for the association this year, and up to date had received from various sources only about $600. A committee was appointed to audit accounts and arrange to pay all bills. Mr. Brooks' committee reported an expense of $325.

The secretary reported that 40 telephone companies had joined the association during the year. Mr. Coleman then thanked the association for all courtesies shown him as an officer of the association. President Barnhart, in a few well-chosen words, expressed his gratitude to the association for the many kindnesses shown him.

The nominating committee reported its action. It recommended a vote of thanks to President Barnhart and the other officers, which was given. The following-named gentlemen were then elected as the officers of the association:

President—Theodore Gary of Macon, Mo.
Vice-president—William R. Fee of Milford, Ohio.
Secretary—L. L. C. Brooks of St. Paul, Minn.
Treasurer—A. B. Conklin of Aurora, Ill.
Executive board—C. E. Hull of Salem, Ill., S. S. Lichty of Vinton, Iowa, J. G. Splain of Pittsburg, Pa., Richard Valentine of Janesville, Wis., Walter Matthews of Maysville, Ky., E. D. Graham of Mexico, Mo., C. W. Wells of Marion, Kan., H. A. Barnhart of Rochester, Ind., W. G. Jones of Columbus, Ohio.

The committee which is to have in charge the association's interests in the consolidation proceedings to be conducted with the National association was then announced and consists of H. A. Barnhart, Theodore Gary, L. L. C. Brooks, E. M. Coleman and C. E. Hull.

Convention Notes.

Hall L. Brooks, the popular cedar-pole man of Tomahawk, Wis., was a conspicuous figure at the convention. Mr. Brooks, who is well known for his energy, has built up a most excellent trade among users of cedar poles, and he anticipates a largely increased business during the coming year.

President George L. Lindsley and Manager J. Allan Navarre represented the Lindsley Bros. Company at the convention. The Lindsley company is among the oldest producers of poles, and with its excellent facilities for producing Michigan, Idaho and Washington poles it is enabled to obtain its full share of the cedar-pole business.

R. R. Genge, recently appointed manager of the cedar-pole department of Francis Beidler & Co., Chicago, represented this well-known concern at the convention. Mr. Genge is an old-time cedar man and is well qualified to take care of this growing department of the Beidler company.

The exhibit of the American Steel and Wire Company was among those which attracted most attention. A complete line of telephone wires and cables was shown, including a panel of samples which was exhibited at the Paris Exposition. The exhibit was in charge of Assistant General Sales Agent George F. Rummell. The following-named representatives were also in attendance: C. S. Knight, Jr., manager of the electrical department, W. C. Bogue, George Chandler, F. J. Conkling and W. A. Gairnes.

An attractive display was made in room 640 by the Kester Electric Manufacturing Company of Chicago. The leading feature was the clock made of pins which was on exhibition in a booth at the St. Louis Fair and which has been described and illustrated previously in the Western Electrician. The clock is of exceptionally artistic design and attracted universal attention, and delegates at the convention were enthusiastic in their praise of it. The clock was built to show the possibilities of Kester self-fluxing solder. This solder, together with cans of Kester paste and bottles of Kester soldering salts, completed one of the handsomest exhibits at the convention and served well to increase interest in an excellent line of goods.

Telephone News from the Northwest.

The long-distance line of the Tri-state Telephone Company has been completed from the Twin Cities to Grand Forks, N. D.

The stockholders of the Nicollet County Telephone and Telegraph Company have voted to purchase the local exchange in St. Peter, Minn., for $35,000. The local system includes exchanges in St. Peter and Kasota, and 43 miles of lines.

The Blue Earth Telephone Company of Mankato, Minn., has been granted admission to New Ulm, Minn., for a single-toll instrument, on a 10-year franchise, being required to pay $1,500 for the privilege.

G. W. Hart of Egan, S. D., who owns the telephone system there, has bought the local exchange at Flandreau, S. D. He proposes to connect the two rural systems into one, operated as a whole, independent of either local exchange.

The local exchange at Barnesville, Minn., has connected with the long-distance lines of the Northwestern Telephone Exchange Company.

The Cambridge Telephone Company has been formed at Cambridge, Minn., to build a local and rural system. It is allied with the Tri-state Telephone Company.

The council of Anoka, Minn., has voted to order the Twin City Telephone Company to remove its toll line from that city.

The Southwestern Minnesota Telephone Company has been granted a local exchange franchise at Westbrook, Minn.

A stock company has been formed to assume the business of the Home Telephone Company at Grand Meadow, Minn.

The Rainy River International Telephone Company has been granted a charter to install local exchanges at Fort Frances, Ont., and neighboring towns. The company plans exchanges on the Minnesota side of the river as well, with long-distance connections with Winnipeg.

The town of Geddes, S. D., has voted a franchise for a local and long-distance system to the Dakota Central Telephone Lines.

The Wisconsin Telephone Company is arranging to rebuild its exchange at De Pere, Wis.

Telephone companies in Minneapolis have asked the board of park commissioners to appoint a man who may be consulted as to trimming trees to run telephone wires, the companies to pay his salary.

The Fosston Telephone Company has completed a telephone line from Fosston, Minn., to Winger and Sletten.

An election will be held at Gowrie, Iowa, for the purpose of voting a telephone franchise to J. F. Nordin.

An ordinance has been proposed at Cedar Falls, Iowa, to grant admission to the city of the various rural lines. The ordinance will be satisfactory to the Cedar Falls Mutual Telephone Company.

The South Dakota Telephone Company of Pierre has incorporated with a capitalization of $100,000. A. Ewart heads the list of stockholders. The company proposes to build a telephone line from Pierre into the Black Hills.

The Michigan State Telephone Company is planning building a line next summer connecting the Gogebic Iron range with the copper region. This will be accomplished by connecting Wakefield and Nestoria.

The Bell telephone exchange at Keokuk, Iowa, has been destroyed by fire. R.

Ohio Telephone Notes.

Herbert R. Ashbrook of Toledo has addressed a letter to the Home Telephone Company of Louisville, Ky., asking that the plan of expending earnings for extensions be changed and bonds issued for that purpose. He says the company should begin paying dividends now, in order that its stock and bonds may be worth something in the markets. Mr. Ashbrook figures that the company may begin to pay dividends at the rate of two per cent. on the first of the year. The company has $120,000 bonds in the treasury, and there yet remains of an issue authorized some time ago $1,400,000. With the company paying dividends, there would be a good market for these bonds, and the company could realize on them for the necessary extensions.

Officials of the Cuyahoga Telephone Company are well pleased with the prospects for the company's future. Taking the latter part of this year as a basis, they believe the company will earn six per cent. on both the preferred and common stock in 1905. As a new switchboard was put in this year, there will be nothing to hinder operation for some time to come.

Barber & Brailey of Toledo have sold their bond holdings in the Utica Independent Home Telephone Company, amounting to $75,000, to a syndicate of eastern men.

The Pryor-Bode Telephone Company of Rinard's Mills has been incorporated with a capital stock of $5,000 by J. W. Pryor, G. E. Bode and others.

T. R. Mason, C. A. Carr, H. M. Anderson and others have incorporated the Sugar Grove Telephone Company, Sugar Grove, with a capital stock of $5,000.

Two outdoor telephone booths have been established on Euclid Avenue, Cleveland, by the Cuyahoga Telephone Company. They are made of iron and a directory is fastened on the door inside. For the remainder of this year the service will be free, but after January 1st the regular pay-station charge will be made. If the booths prove successful other stations will be established over the city. Another innovation of this company is the establishment of a place for making coffee and tea for the operators, most of whom bring their lunches with them. This fits in with the co-operative system that was established by the company over a year ago. Officers feel that this idea has been successful, and they are willing to carry the matter a little further, believing that the expense is well incurred.

The new circuit of the United States Telephone Company between Columbus and Toledo is nearing completion. It is in operation to a point near Marysville.

An increase of capital stock from $5,000 to $15,000 has been made by the People's Telephone Company of Chester Hill. C.

Indiana Telephone Items.

The City Council of Lebanon has granted a 20-year franchise to the Central Union Telephone Company to operate a local exchange. The passage of the ordinance was a great surprise to the people, as few knew that such a step was even thought of by the council. The people are opposed to a dual system, and the mayor is asked to veto the ordinance. If the franchise is passed over his veto, it is insisted that the price be fixed at an amount no greater than is charged by the local company at present.

The Central Union Telephone Company has applied for a franchise to operate a local exchange in Crawfordsville.

S. P. Sheerin, president of the New Long-distance Telephone Company of Indiana, has been making a tour of the state, investigating the feasibility of inaugurating a telegraph business over the regular long-distance telephone wires while the latter are in use. The telephone company proposes, it is said, to open telegraph offices and send messages to any point reached by its lines at a material reduction from the rates now charged. The expense will be inconsiderable, since the telephone lines are already in operation and earning a profit on the investment from the telephone business. The question is raised as to the right of the telephone company, under its charter, to operate telegraph lines, but Mr. Sheerin feels confident that there will be no trouble. "Our company has telegraph communication to Lafayette, Marion, Fort Wayne, Muncie and Terre Haute. The wires are used for news service only," said he.

The report of the Home Telephone Company of Fort Wayne, which has made a success in Indiana, shows a total of 3,220 telephones in use, with an average growth of 50 per month. The company owns its own building, worth $40,000, and it has $32,000 in the sinking fund for redemption of $250,000 outstanding six per cent. bonds. It sets aside 6¼ per cent. yearly for sinking fund and pays two per cent. on stock. At a recent meeting C. S. Bash was elected president, W. L. Mollering, secretary, and M. B. Fisher, treasurer.

There is strong competition between the two telephone companies operating in Greenfield. The Independent was almost alone in the field until a year ago, when the Central Union entered. It is now possible to talk with competing points for 15 cents, while with non-competing points which both companies do not reach, the cost is three times as great. Difficulty has been experienced in calling out the fire department, owing to the fact that members of the department have installed different telephones. Mayor Carr ordered the engineer at the city pumping station to pay no attention to an alarm turned in over the Central Union. This order is being generally criticized, and the City Council will consider the matter at its next meeting.

The Blue River Valley Telephone Company has filed articles of incorporation. The capital stock is $12,000. The company proposes to build and operate a telephone system in Washington County, with the principal exchange and office in Salem. J. H. Tattock, C. A. Martin, E. G. Philips, J. E. Brewner and Arthur Purlee are the incorporators. S. S.

Southeastern Telephone Developments.

The Board of Aldermen of Statesville, N. C., has just refused a franchise to the Bell Telephone Company, which desired to enter the local field and buy the local exchange.

The Southern Bell Telephone Company has awarded the contract for a handsome three-story exchange and office building at Greensboro, N. C., to cost about $15,000.

After a long fight a franchise has been granted a telephone company at Anderson, S. C., allowing, among other privileges, the charging of tolls to outside points in the surrounding section.

Estimates are being made by the Southern Bell Telephone Company for putting up aerial cables in the town of Cordele, Ga., thus completing the remodeling of the local exchange.

There is some talk of extending the lines of the Bell Telephone Company about Beaufort, S. C., to reach many farmers. L.

GENERAL TELEPHONE NEWS.

An office of the Sunset Telephone Company is shortly to be established at Sparks, Nev.

The line of the Big Blackfoot Telephone Company between Drummond and Ovando, Mont., has recently been completed.

The Deschutes Telephone Company will at once begin the construction of a telephone line from Bend to Laidlaw, Ore.

The toll line of the Home Telephone Company of Kansas City has reached Ottawa, Kan., and will be extended to the Kansas oil fields.

The business men and farmers around Byron, Okla., have met and organized a mutual telephone company, to build an exchange and rural lines.

A new switchboard which will cost about $35,000 will be installed in the near future at Ogden, Utah, by the Rocky Mountain Bell Telephone Company.

Newspaper reports of a revival of the movement to form a combination of the Independent telephone manufacturing interests of the country are denied by Chicago manufacturers.

In the suit of the city of Wichita, Kan., against the Missouri and Kansas Telephone Company, it has been decided that the telephone company has the same right to extend its wires through the city that the telegraph companies enjoy.

A telephone exchange has just been completed at South Haven, Kan., by R. W. Kemp, contracting engineer of Wichita, for the Farmers' Mutual Telephone Company. Mr. Kemp has also contracted to build the mutual lines for the Chickaskia Mutual Telephone Company from Milan to Wellington, via Mayfield, and for the Oxford Mutual Telephone Company from Oxford to Wellington, via Dalton. The lines, when complete, will connect with the Farmers' Mutual Company at Wellington and make a system of over 2,000 subscribers.

The Stark Telephone, Light and Power Company, in a proposition made to the Board of Control of Toronto, Ont., for an Independent telephone system in the city, offers telephones at a maximum price of $36 per annum for business places and $18 for residences. The company guarantees that it will have 3,000 subscribers in six months and have its system in operation within 15 months. Electric current will be sold at 10 cents per kilowatt-hour, less 20 per cent. discount for prompt payment. Provision is also made for the expropriation of the company's plant if any agreement with the Bell company, tending to destroy competition, is discovered, and the company is to pay 2½ per cent. on its revenue to the city for the first five years and five per cent. thereafter.

Manager R. B. Anderson of the Black Pearl mines in Idaho states that the company is about to install new hoists, to be operated by electricity transmitted from the electric power plant at Payette, Idaho.

Physics and Electricity.[1]

By Prof. William Hallock.

It is in general not very profitable to spend much time in evolving an elaborate classification of the sciences and their inter-relations, nevertheless, it may at times be well to take a survey of the situation, a sort of birdseye view, without any special reference to the boundaries, which are artificial and merely useful for ready reference.

In a way physics should be considered to include both the branches which we refer to under the name of physics and chemistry. Phusis and phusikos and ta phusika refer to the essence of all matter and its nature; nevertheless one branch of the subject has so grown out of proportion to the original trunk, science, that it occasionally forgets its relationship. We may say that the structure of the "atom" of the chemist, the ultimate nature of primordial matter is considered in the domain of physics, while chemistry busies itself with the combinations of these atoms into molecules, the results of the combinations of the molecules into masses and their behavior as such is again physics. Every great generalization, every marked step toward the goal has been in the nature of a simplification, a reduction of the number of the unrelated phenomena of nature. Usually, we think of physics as dealing with elementary mechanics, sound, heat, light, electricity and magnetism. Sound has long since been properly classed as a particular case of the mechanics of elastic matter; heat and light, and most of the phenomena of electricity and magnetism have been similarly relegated to the domain of the mechanics of the "ether," and no one doubts that the other outstanding puzzle, gravitation, will also fall into this class. It is, then, the mechanics of the ether which must hold the solution of all of our conundrums, and that is the direction in which the vast majority of investigators are struggling at the present time. What are the relations of matter and ether, or are they identical? That is the question.

In the latter part of the '70's Sir William Crookes made a brilliant series of experiments upon what he then called "radiant matter." He showed very beautifully that when the greater part of the air is pumped out of a glass tube, and then a current of electricity sent through the gas by means of electrodes, that under these conditions there were sent out from the cathode small particles of matter, traveling at high velocities in straight lines until they struck the other side of the tube, or some intervening object. Ten or 15 years later the investigation of this radiant matter was taken up more vigorously, and Lenard found that by placing a small aluminum window opposite the cathode, he could cause the cathode particles to pass through the metal and travel some distance through the outside air. It had also been found that these particles carried a charge of negative electricity, and were consequently deflected by a static electric charge or by a magnetic field. In the last decade of the last century Roentgen discovered that where one of these particles was stopped by striking upon some object a new form of radiant energy was sent out. Not knowing its nature, he called it X-rays, being recognized the world over as the "unknown quantity." Becquerel, soon after, discovered that uranium emitted a sort of radiant energy, which was then called Becquerel rays. In the mean time the radiant matter of Crookes had come to be known as cathode rays, and Goldstein had shown that a corresponding condition of matter carrying positive electricity could be produced, and called it "canal rays." We have, then, the cathode rays, particles of matter carrying negative charges; when one of these particles strikes, it produces a few waves in the ether, an ether pulse, as when a stone is thrown into a pool of water, this is X-rays. The radiations from radium and its analogues were soon identified as follows: The alpha rays are particles of matter carrying charges of positive electricity, traveling with a velocity of about 20,000 miles per second, and about the size of two atoms of hydrogen, it would take 5×10^{23}, i. e., 5 followed by 23 ciphers of these alpha particles to weigh one gram (a gram is equal in weight to about 15 grains). The alpha particles have a very slight penetrating power; two ten-thousandths of an inch of aluminum, or a sixth of an inch of air will cut off half the alpha radiations. The beta radiations are the radiant matter of Crookes, the cathode rays of the present, particles of matter carrying negative electricity, traveling with a velocity of 160,000 miles per second, they are only one two-thousandth the size of the alpha particle, and are much more penetrating, one half passing through a fiftieth of an inch of aluminum, or two inches of air. The gamma rays are like X-rays, a pulse in the ether, and travel with the velocity of light, 186,000 miles per second.

By the deflection of the alpha and beta particles under the influence of a static field or a magnetic field, it has been possible to determine the above facts, and many other independent phenomena confirm them most beautifully.

When a current of electricity is sent through a solution of common salt the molecules are immediately involved in a series of interchanges, all the atoms of the element sodium immediately start toward the negative plate, because they carry positive charges, and all the atoms of chlorine start in the opposite direction toward the positive plate, because they carry negative charges. Thus the mechanics of electrical conduction is a procession of positively charged particles, ions, traveling in one direction, and a corresponding procession of negative ions in the opposite direction. This is the only way non-metals can conduct electricity. Air is ordinarily a non-conductor; it is not a metal, and it has no postive and negative ions. Under the bombarding influence of the radiations above described, the air is broken up into ions and becomes a conductor, and its conductivity is a measure of the activity of the bombardment. Consequently we may use the conductivity imparted to air as a measure of the degree of radioactivity.

Prof. J. J. Thomson puts forward the hypothesis that the small particles of the cathode rays are the primordial form of matter from which all the elements are built up, and proposes the name of "corpuscle" for them, but they are generally called electrons. He even suggests very beautifully that the electron may be nothing more than a charge of negative electricity, and that when we have about a thousand of these combined with a neutralizing amount of positive electricity, we have an atom of hydrogen, 16,000 gives oxygen, etc. When a gas is ionized, for example, by a beta particle, it has one of its electrons knocked off, and consequently is left effectively positive, and the conditions are fulfilled for conduction of electricity.

The researches of Rutherford, Soddy, Thomson, Rumsay and many others, have led to the following hypothesis as to the mechanics of radioactivity:

The very large atom of radium, some 235 times as large as the hydrogen atom, is in a condition of unstable equilibrium, undergoing gradual disintegration, owing to a loss of some of its original internal energy. The first observable product is a gaseous material called by Rutherford "emanation" this gradually disintegrates farther, and as an end result we obtain helium, a very light inert gas, recognized by its spectrum. There are certainly other products, but they are not in sufficient quantity to be identified. Professor Rumsay has gone even farther, and thinks it possible that elements may be built up by bombarding into an element of lower atomic mass a certain number of alpha and beta particles.

If these hypotheses prove tenable, it would appear that all physics, all matter, everything is electricity, and there is nothing in the so-called material universe but the ether and its mechanics.

1. Abstract of a lecture delivered before the New York Electrical Society, November 30, 1904. Prof. Hallock is one of the faculty of Columbia University.

New York to Boston in Electric Cars.

By the recent completion of an electric railway between New Haven and Wallingford, Conn., it appears that one can now ride from the City Hall in New York city to the Boston State House in electric cars, making close connections at every transfer point. The accompanying map, for which the New York Times is responsible, shows the route.

The cost of the trip, on a fairly comfortable basis,

MAP OF ELECTRIC-RAILWAY ROUTE BETWEEN NEW YORK AND BOSTON.

is from $15 to $17, but this includes stop-overs at first-class hotels. The journey can be made in three days. Four days are better, though, and if the traveler is off for a leisurely vacation he will find it pleasanter to spend an even longer time on the road. The route passes many towns of historic interest, besides country sections of varied and picturesque character. The three-day trip to Boston is divided as follows: First day, New York to New Haven; second day, New Haven to Springfield; third day, Springfield to Boston. The four-day trip is broken up in this way: First day, New York to Bridgeport; second day, Bridgeport to Hartford; third day, Hartford to Ware, Mass.; fourth day, Ware to Boston. The actual cost of transportation to Boston is not much over $3. For $20 it is estimated, one can make the four-day trip from New York and add the one-day journey from Boston to Fall River or Providence, stopping at good hotels at each resting place.

The electric trip from New York to Boston is at present, of course, only fitted for the leisurely tourist. If necessary, however, it would be perfectly feasible to operate an electric through line that could compete, on at least even terms, so far as service is concerned, with existing steam roads.

Meeting of Illinois Electrical Contractors.

The fourth semi-annual convention of the Electrical Contractors' Association of the State of Illinois was held in the assembly room at the Illinois Hotel, Bloomington, Ill., on Thursday, December 8th. The meeting was called to order at 10:30 a. m., and, in the absence of the president and vice-president, Arthur Frantzen of Chicago was chosen temporary chairman. The officers of the association are: President, C. L. Brown of Chicago; vice-president, W. A. Robb of Rock Island; secretary, C. R. Kreider of Chicago; treasurer, E. E. Gibson of Decatur. At 12:30 p. m. the meeting adjourned for lunch, the session being resumed immediately thereafter, adjourning again at four o'clock, when a special car provided by the Bloomington and Normal Electric Railway and Heating Company took the delegates to the Chicago and Alton shops for a tour of inspection, which was greatly enjoyed. In the evening a banquet was held at the Illinois Hotel, where an enjoyable time was had.

The Electrical Contractors' Association of the State of Illinois is affiliated with the National Electrical Contractors' Association of the United States. Matters of mutual interest to the contractors were discussed at the meeting. Much credit is due to Guy Carlton, the Bloomington member of the association, for his untiring efforts in making arrangements and seeing that everything was provided for the comfort of the delegates, also to the Business Men's Association of Bloomington, whoses guests the delegates were. The next meeting will be held at Peoria in June.

The following-named gentlemen were in attendance at the Bloomington meeting:

T. D. Allen, Allen Electric Company, Danville.
F. B. Bolte, Broderick & Co., East St. Louis.
Guy Carlton, Jr., Bloomington.
O. H. Norton, Central Electric Company, Peoria.
C. A. Walker, Electric Construction and Machinery Company, Rock Island.
E. E. Gibson, Electric Fixture and Supply Company, Decatur.
I. N. Feger, Feger Electric Company, Peoria.
Ernest Freeman, Ernest Freeman Company, Chicago.
Arthur Frantzen, Arthur Frantzen Company, Chicago.
T. H. Henkle, Henkle Bros., Springfield.
C. R. Kreider, Kohler Bros., Chicago.
J. W. Tanner, Marrs-Tanner Electric Company, Danville.
A. L. Frankenberger, Marrs-Tanner Electric Company, Danville.
Henry Newgard, Henry Newgard & Co., Chicago.
W. E. Wolgamott, Peoria Electric Company, Peoria.
J. B. Scholes, Springfield.
G. A. Sieber, Jacksonville.
C. E. Stapp, Peoria.

Record of Private Ownership in Philadelphia Gas Plant.

After a discouraging experience of many years with a municipal gas plant, Philadelphia leased the works to a private company for a term lasting from December 1, 1897, to December 31, 1927. According to an article by Hayes Robbins in The World Today, the result has been very satisfactory. Better gas is furnished, and the city gets free gas for street lighting and 10 cents a thousand on all gas furnished private consumers. The concluding paragraph of the article is as follows:

"And the larger significance of this is that it points the way for other municipalities to make it good business policy for public-service corporations to justify their position in like fashion. Set the terms, and then keep watch. Whether a city owns and leases its plant, or simply grants a franchise for the rendering of a given service, the crucial point is in fixing the desired conditions at the outset and retaining some sort of effective club in hand as a penalty for failure of the corporation to perform its duties. The Philadelphia experience shows how much more can be done in this direction than has ever been attempted in most of the cases of unsatisfactory service that are cited today as fit subjects for the municipal-ownership panacea.

Electrical Committee of Underwriters' National Electric Association.

The annual two days' meeting of the electrical committee of the Underwriters' National Electric Association was held in New York on December 7th and 8th, the attendance being very good. The chairman of the committee is Mr. F. E. Cabot of the Boston board of fire underwriters, and the secretary is Mr. C. M. Goddard, also of Boston.

The tendency was toward a simplification of the rules, eliminating as far as possible in the matter of detail and method of construction, placing the code instead on a broad plane. A number of minor changes were made to the rules and some explanatory foot notes added.

Representatives of the following associations were present at the meeting: National Electric Light Association, American Institute of Electrical Engineers, National Electrical Contractors' Association and the American Institute of Architects.

Polyphase Transmission with Single-phase Operation for Railway Purposes.

Among the numerous patents that have been allowed to Mr. Bion J. Arnold of Chicago is one issued to him under the title of "System of Electrical Distribution" on November 29th last, the application having been filed on December 17, 1901. This system has for its primary object the transmission and distribution of energy for railway purposes, making use of the minimum amount of copper, the various circuits of the system being to a great extent balanced. By the use of various trolley conductors along the line associated with the ground return, a three-phase system is employed for the transmission, while the car motors under normal conditions operate single phase.

A further feature of the invention consists in the provision of means whereby additional power may be supplied to the motors driving the vehicles over and above that which could normally be obtained from a main trolley circuit. Instrumentalities for this purpose are preferably provided at those portions of the right-of-way at which there is a considerable ascending grade or at such other points in the line where an especially heavy load will be placed upon the motors during their operation, as at stations to aid in starting.

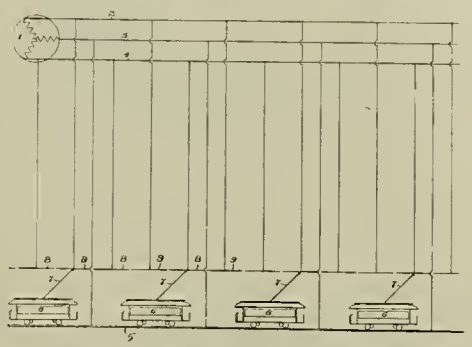
The motors upon the vehicles should be so constructed that they operate efficiently when normally running single phase with the main-trolley or working-conductor construction and also operate efficiently (while exerting a greater torque, however) when associated with a main trolley conductor circuit and the means for supplying the additional power. To accomplish this result single-phase motors are utilized upon the vehicles, which motors are preferably arranged in some suitable manner to be self-starting and to supply a reasonably strong starting torque. They, moreover, should be able to operate efficiently when supplied, for example, with two-phase alternating current, which additional phase is suitably conducted to the motors through the agency of auxiliary trolley conductors.

The vehicle traction motors, constituting one form of translating means that may be supplied with power according to the invention, are supplied with current alternately from the different circuits of the system so that the energy consumed is equalized between the various circuits of the transmission system, and this accomplished through the use of but a single trolley mechanism. The manner of constructing the trolley-conductor system so that a balance of the transmission system may be normally attainable consists in subdividing the trolley conductors into isolated sections and connecting alternate sections to unlike transmission conductors of the system. By electrically uniting another transmission conductor of the system permanently with a ground return a return circuit is provided, which, as a general proposition, includes the rails upon which the vehicle is to operate. The vehicle thus at one time receives power from two of the mains of the transmission system included in one of the circuits of the multiphase transmission system and at another time receives its current from the mains of another circuit of the system which conducts current of a different phase. Thus the vehicle motor while normally operating receives none but single-phase alternating currents from the transmission system. In order to accelerate the operation of the vehicle or to increase the torque of the motor actuating it, the auxiliary current-conducting means are provided so that a vehicle at such portions of its roadbed may be supplied with additional power by receiving current simultaneously from the main and the auxiliary trolley conductors, which are preferably electrically connected to separate mains of the transmission system, so that out-of-phase currents are supplied to the vehicle motor.

An additional conducting or third rail may be employed as the auxiliary trolley conductor to supply the additional phase to operate the vehicles when under heavy load. In order to provide a safe construction for the auxiliary current-conducting rail to avoid accidents to persons or animals crossing the right-of-way, a transformer may be placed between the third rail and the conductors of the transmission system from which it derives its current, whereby current is supplied to the third rail at a voltage sufficiently low to preclude the possibility of any disastrous results when persons or animals accidentally form connection between the third rail and the ground-return rails.

It is preferable so to arrange the controller system that but one operating handle need be employed to effect normal regulation of the speed of the driving motor and also to regulate its speed when the additional phase is required to furnish additional power. Any suitable self-starting single-phase motor may preferably be employed whose construction and circuit arrangement may then vary, if necessary, in accordance with the invention, by placing additional windings thereon corresponding to the additional phase. A motor might also be employed which, while not inherently self-starting, is provided with means whereby it is brought to speed.

The accompanying illustration shows in a general way the essential features of the system. A three-phase alternating-current generator (1) supplies current to the transmission mains, the style of generator shown being in this instance provided with an armature having the Y system of connection. One of the transmission conductors (3) in this particular



POLYPHASE TRANSMISSION WITH SINGLE-PHASE OPERATION FOR RAILWAY PURPOSES.

instance is electrically connected with a ground connection comprising a continuous rail (5) of the roadbed, along which cars are designed to travel. The cars are provided with trolley poles which are adapted to engage the trolley wire included in the conducting circuits.

In order so to arrange the trolley conductors that the distribution of current between the various circuits of the polyphase transmission system is made as uniform as possible, the trolley conductors are subdivided into isolated sections and connect alternate sections with the same transmission main, thus forming two sets of trolley conductors when the invention is applied to three-phase systems of distribution.

Alternate sections of the trolley mains are associated with the same transmission main, as shown in the diagram, the sections (8) (8) (8) being connected with the transmission main (4) and the sections (9) (9) (9) being connected with the transmission main (2), while the ground return, comprising the rail sections (5) is electrically united to the transmission main (3). It will thus be apparent that the cars in operating along the right-of-way receive current alternately from trolley sections (8) and trolley sections (9), so that the cars are at one time—that is, when the trolley wheel or contact is in association with a conductor section (8)—included in a circuit of the generator (1) supplied by the mains (3) (4) and at another time—that is, when they receive current from the sections (9)—included in another circuit of the generator supplied by the transmission mains (2) (3). When a number of cars are continuously operating along the right-of-way the power derived from a polyphase generator and utilized in propelling the cars is very evenly distributed between the circuits of the transmission system, and this advantage is obtained through the use of but a single line of trolley wire which is adapted normally to supply current to the cars.

In practice it is frequently desirable to accelerate the speed of the vehicle above the normal along some portions of the right-of-way or to maintain the normal speed of the vehicle even though excessive load be placed upon the motor. In order to do this, auxiliary means are provided at these portions of the right-of-way, which auxiliary means are adapted to supply additional power to the driving mechanism over that which is normally obtainable from the main trolley wire. The means employed include an auxiliary conductor circuit in the form of a trolley-conductor third rail insulated from the ground-return circuit of the system. The third rail is energized from a transmission main other than the one which is electrically associated with the trolley conducting section paralleling or running alongside of the third-rail section. The length of the sections of the supplemental trolley conductors or third rail will, of course, depend on the local conditions—as, for instance, upon the number of cars operating in the system, their speed and the number of grades and stops. When the car is thus being supplied with energy from the main trolley wire or conductor and also from the third rail, alternating currents of two phases may be supplied to the motor to cause the motor to develop a torque which is in excess of that under which the motor is adapted normally to operate, but which is in conformity with the increased load which the motor is called upon to move.

Electrification Estimate in Chicago.

In accord with the request of Judge Grosscup General Manager John M. Roach of the Chicago Union Traction Company has supplied the receivers with the following statement of the cost of "electrifying" the present North and West Side cable lines:

Chicago, December 10.—James H. Eckels, M. E. Sempsell, John C. Fetzer, receivers Union Traction Company, Chicago: Gentlemen—In compliance with your request of December 3d, I submit herewith estimated cost of changing our present cable system into an electric trolley system:

Total cost of copper, 1,732,000 pounds, at 15 cents per pound	$259,800
Cost of complete installation of 1,500-kilowatt generator in California power house, which includes boilers, foundations and all electric connections	150,000
Cost of 4,500-kilowatt storage battery	375,000
Cost of motor equipment, new, for 318 cars, figuring on G. E. 800 motors	318,000
Cost of trucks for 318 cars	71,550
Cost of water-heating apparatus for 800 cars	80,000
Cost of construction of 16 miles of overhead double trolley, including feed wire	96,000
Total	$1,350,350

This would involve the changing of the entire Madison Street, Blue Island Avenue, Milwaukee Avenue, Clybourn Avenue, North Clark Street and Lincoln Avenue cable lines into trolley lines—about 16 miles in all.

Mayor Harrison and the city officials are watching closely the outcome of the proposition to "electrify" the Chicago Union Traction Company cable lines outside of the downtown district. The city has opposed the substitution of the trolley for the cable in the outside district on the theory that it would give the traction company a much more advantageous position in the fight over the 99-year claims.

Electric Express Delivery in Washington, D. C.

The electric automobile delivery service recently installed in Washington, D. C., by the Adams Express Company is proving a big success, and there is little doubt that it will be continued and extended during the coming year. The local management of the company is preparing data showing the rela-

ELECTRIC EXPRESS WAGON IN WASHINGTON, D. C.

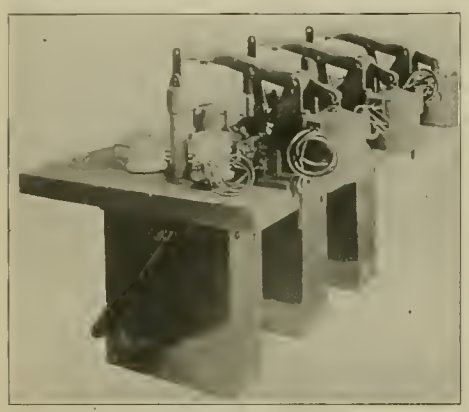
tive cost of operation of the horse-drawn vehicles and the automobiles, and this will be incorporated in a report which is to be made to the board of directors of the company. The accompanying picture shows one of the electric delivery wagons with a load of parcels. Ten of these vehicles are in service and eventually 30 or more will be used. Each wagon weighs 3,000 pounds and has a carrying capacity of 2,000 pounds. It is equipped with a 60-cell Edison storage battery. A garage, with charging facilities for 18 machines, has been provided in the company's stable on B Street.

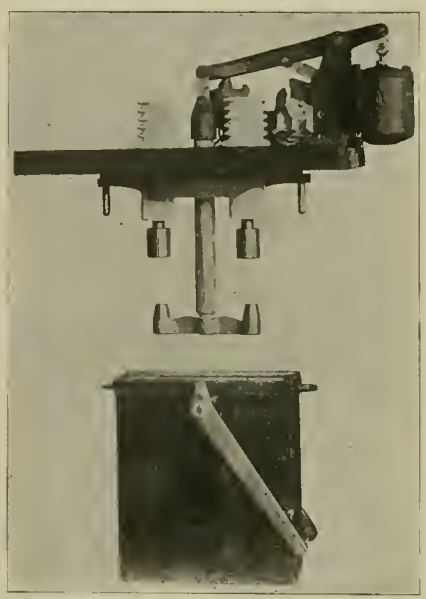
The Mallory Steamship Line has decided to equip all of its vessels with space-telegraph apparatus. The steamship Denver is the first of the liners to be equipped. The De Forest system will be used, and as that company intends to establish many stations along the Atlantic and Gulf coasts, the result will be that the Mallory vessels will always be presumably in wireless range of land. The Mallory Line is the first of the coastwise companies to install the wireless system on its vessels.

Westinghouse Oil Circuit-breakers.

Systems of very high voltage and capacity have received much attention from engineers, but a demand has arisen for a piece of apparatus of somewhat smaller capacity, which shall be compact, reliable, and suited for electrical operation. The Westinghouse system of solenoid operation is especially adapted to such a form of apparatus, and has been used in a new line of circuit-breakers, illustrated herewith. This form of apparatus is automatic, with oil break, adapted for remote control and designed for voltages of from 3,300 to 25,000.

The circuit-breaker is made in single-pole units, each being mounted apart from the switchboard in a brick or concrete compartment. Two, three and four-pole combinations are made by placing the units side by side. The base of each unit is of treated soapstone, and holds two heavy porcelain insulators which carry the stationary contacts and the connection to the external circuit. The movable contacts are at the ends of a U-shaped metal casting fastened at the center to a rod of treated wood, which is moved up and down by the operating mechanism in closing or opening the circuit. The final arc on





WESTINGHOUSE OIL CIRCUIT-BREAKERS.

breaking the circuit is taken by an arcing tip, which may easily be replaced.

The contacts are of the typical Westinghouse design and deserve especial notice. The movable contacts are in the shape of truncated cones and fit into corresponding surfaces in the stationary contacts which are made up of a number of copper springs. This arrangement not only gives a large area of contact but insures a positive contact over its entire surface, and entirely prevents "freezing" under any condition of overload. The tanks are liberally insulated and the inner surface so shaped as to reduce the amount of oil required, and therefore the fire risk to a minimum. The open position is in all cases maintained by gravity.

A simple system of levers and toggles is mounted on the top of the base and a powerful electromagnet is arranged with its movable core attached to the lever system, so that when the magnet is energized the circuit-breaker will be closed. The standard voltage used on the solenoid is 125 volts. A second electromagnet acts as a tripping coil and may be controlled by a relay of any desired type. A small single-pole double-throw switch is mounted on the base and is operated by the motion of the levers in opening or closing this circuit; it controls the telltale indicator and lamp which are mounted in view of the operator.

The entire mechanism is compact and solid in construction, while the insulation has been carefully provided for. As in other Westinghouse oil circuit-breakers, the break takes place near the surface of the oil instead of at the bottom, where there is almost always a certain amount of sediment. These circuit-breakers have no live parts exposed. The oil tanks are firmly held in position by special holders which, by the simple movement of a lever, may be removed and all contacts examined without disturbing any other part of the circuit-breaker. The ultimate breaking capacity of these circuit-breakers is, for single-phase, 6,000 kilowatt; two-phase, 12,000 kilowatts; three-phase, 10,400 kilowatts.

Electricity for Transcontinental Steam Railroads.

Several steam railroads in the Trans-Mississippi region are changing from steam to electric power on their suburban trains, and now investigations are in progress looking to the substitution of electric motors for heavy freight engines on two transcontinental roads. These investigations have already revealed, it is said, that the waterpower in the Cascade Mountains is sufficient to furnish electricity for motors to take the place of steam engines on the mountain division, and that the cost of generating and transmitting electrical energy will be much less than the cost of the coal now used in the locomotives. Last year, it is said, the Northern Pacific and Great Northern steam roads used over 3,000,000 tons of coal, and the average cost was over $2 a ton.

Distinguished Ladies Inspect Electrical Novelties.

The Boston Edison Company takes pride in its exhibition department, the purpose of which is indicated by the name. In a recent issue of its house organ, Edison Light, it tells the following interesting story of this department:

A handsome coupe stopping in front of the exhibition department of the Edison Company is no unusual sight, but when one did so, during the afternoon of Monday, November 14th, and two distinguished and stylishly gowned ladies alighted and entered, the instantaneous flutter of excitement which pervaded the group of 40 or 50 ladies present gave evidence of unusual interest on their part, and this excitement increased as the names of Mrs. Jack Gardner and Madame Melba were whispered about. These two ladies, apparently unconscious of the interest their appearance aroused, proceeded to look over the many electrical exhibits, evincing a lively interest in everything, but especially in those appliances intended for use in the home. The electric cooking, as demonstrated, seemed to appeal to them especially, and Madame Melba no sooner saw the electric irons than she immediately ordered one of the small "ladies' traveling irons" delivered in her apartments in the Hotel Touraine, and drew a pleasing verbal picture of the facility with which her maid would be able to give the finishing touch to some of her delicate apparel.

The house elevator aroused much interest on Mrs. Gardner's part, and she regretted not having known of it when she built her famous "palace" and was obliged to import the kind she there installed, admitting that the one exhibited has some decided advantages over hers. Both ladies showed an unusual knowledge of the advantages possessed by many of the heavier pieces of apparatus, and by their questions evinced an appreciation of their merits hardly to be expected.

The device which appealed most strongly to them both was the dainty little massage machine. When the charming prima donna spied it she immediately expressed the desire for a treatment, and declared, with many expressions of delight, that the headache from which she was suffering when she entered the room was wholly and almost immediately dispelled by a five-minute application of the truly wonderful little machine.

The ladies were anxious to see everything that was to be seen, and after writing their names on the telautograph, and seeing them reproduced in their identical handwriting at the other side of the room, left, with many expressions of pleasure and appreciation of the enterprise of the Edison Company in opening so comprehensive and instructive an exhibition.

Western Union Defeated in Pennsylvania Railroad Case.

A press dispatch from Washington, D. C., states that the Pennsylvania Railroad Company has won its fight for the removal of the poles of the Western Union Telegraph Company from the railroad's right-of-way. The Supreme Court of the United States has decided in favor of the Pensylvania company in the case brought against it by the Western Union company, involving the right of the railroad to remove the poles of the plaintiff. The opinion was handed down by Justice McKenna. The court holds in its decision that the congressional act of 1866, which controlled in the case, does not grant eminent domain to telegraph companies over the private property of railroad companies. By this decision the Pennsylvania company is permitted to retain the wires of the Postal Telegraph company on its lines east of Pittsburg, which were placed there two years ago, when the railroad company, after notifying the Western Union that its contract had expired and would not be renewed, summarily chopped down the poles of the telegraph company at the end of a six-month period of grace.

Steam Turbines for New Baltimore Power Plant.

An interesting feature of the recently announced developments in Baltimore is the exclusive adoption of the steam turbine as the prime mover in the new plant of the Baltimore Electric Power Company. A contract recently closed with the Westinghouse Machine Company provides an initial equipment of 4,000 kilowatts in two generating units of 2,000 kilowatts each. An electrical equipment, complete and modern in every particular, has also been contracted for.

Officers of the company state the power plant will embody the latest developments in steam and electrical engineering. The building is to be of fireproof construction throughout, the structural-steel frame also serving as supports for the boilers and the overhead coal bunkers. Being located outside of the congested districts of the city, all the boilers and heavy machinery will be on the ground floor. Floors and roofs will be of steel-concrete construction.

The company has secured a lot fronting on Gould Street and extending to the Patapsco River. This property comprises 6.4 acres, and by filling in to the wharf line, over three acres will be added to the area, which will give the company sufficient space to take care of the electric needs of Baltimore for a long period. The location of the plant on the water front, with the Baltimore and Ohio and Wabash railroad systems adjoining, affords ample facilities for securing coal either by rail or water. The distance from the center of the city to the new power house is about two miles and a half.

The steam-turbine plant will operate with a boiler pressure of 175 pounds and a superheat of about 100 degrees. A high-vacuum condensing system will be installed, capable of sustaining a vacuum of 28 inches at full load on the plant.

The plant in its entirety has been designed on the separate-unit plan, which virtually consists of a number of distinct power plants, placed side by side, each entirely separate from the other, but each capable of helping out the other in case any link in the system should be disabled. This holds good through the coal-handling apparatus, the boilers, steam piping, turbines, condensers, generators, switchboard, underground cable, etc., from the coal pile to the customer's building. In addition to this precaution against interruption of service, which is thus insured, the company will install a large storage battery, which will ordinarly "float" on the system.

The Baltimore Electric Power Company was recently organized with an authorized bond issue of $7,500,000 and a capital stock of $3,500,000. The officers of the new company are: President, D. E. Evans; treasurer, R. F. Bonsall; secretary, W. T. Spring. Pending a permanent organization, the directors of the new company are H. W. Webb, D. E. Evans, John T. Stone, W. T. Burroughs, R. F. Bonsall, W. T. Spring and George R. Webb

The construction work is already under way, and will be pushed as rapidly as possible, in order that the plant may be complete in all respects and running smoothly by next July

Japs' Methods of Destroying Electrically Charged Entanglements.

Frederick Villiers, artist for the Illustrated London News at Port Arthur, gives an interesting picture in that paper, ilustrating a wire entanglement on Banduzan Hill, the destruction of which gave the Japanese officers much concern, as the wires were understood to be highly charged with electricity. At length, he adds, they hit upon the idea of placing a charge of guncotton at the end of a stout bamboo 20 feet long with a fuse running down the center. Two soldiers then pushed the bamboo up to the entanglement, placed the charge against the supports, and fired the fuse from their end. The men suffered terribly from shell fire from the opposite fort before the Eleventh Division attacked it. After many lives had been lost in the attempt to destroy the entanglement it was discovered that the wires were only weakly charged with electricity, and accordingly they were cut with shears fitted with non-conducting handles."

Nobel Prizes Awarded.

A dispatch from Stockholm, dated December 10th, says that on that day the annual Nobel prizes were awarded as follows: Physics, Lord Rayleigh, professor of natural philosophy in the British Royal Institution; chemistry, Sir William Ramsay; medicine, Professor Pavloff of the Military Academy of Medicine at St. Petersburg. The prize for literature is divided between Frederick Mistral of France and Don José Echegaray of Spain. The peace prize is awarded to the Institute of International Law.

Electricity in an Ohio Coal Mine.

The electrical equipment of the Midvale-Goshen Coal Company at Wainwright, Ohio, although the plant is not yet complete, is of considerable interest. The haulage plant which draws the cars from the mine is operated by a 40-horsepower Westinghouse motor, power being conducted by band-and-pinion wheels to an enormous wheel set at an angle to the horizontal, about which a steel-wire cable passes. This cable connects with a similar wheel at the bottom of the slope inside the mine. It is fitted with small pulleys which run in grooved tracks on the trestle to the mouth of the mine and down the slope to where the cars from the mine proper are met. Automatic dogs on this cable catch the cars when they are placed in position and release them at the highest point on the trestle, whence they run by gravity to the dump. Here they are automatically emptied onto the screen, which in turn throws the coal into the loader. The cars then pass back by force of gravity on the return track to a point where they are caught by the cable and returned to the mine.

The current for the motor is furnished by a 150-kilowatt Morgan-Gardner generator, operated by a 225-horsepower McEwen engine. This generator also furnishes current for electric lights about the plant and throughout the mine and to the 39-inch Morgan-Gardner cutting machines, with which the mine is equipped, one now being in operation. As the plan contemplates the operation of another mine, two more generators are to be installed shortly, one of 100 kilowatts and the other of 150 kilowatts capacity. A 150-horsepower Erie engine has already been installed to operate the smaller machine, and another McEwen engine will be put in for the larger one.

A feature of this mine will be the self-propelling trucks for the coal-cutting machines, which are now dragged around by burros. The trucks and small gathering motors will be operated on the trolley system, wires being placed along the side of the entrance and the rooms. A knife switch will be placed at the entrance of each room, so that the current may be turned off when the machines are not working in any room. This will obviate the danger of miners getting injured by coming in contact with the wires. The introduction of the trolley system will do away with the reels on the machine trucks and gathering motors and make the operation of both more convenient. The tracks will consist of steel bonded rails.

The haulage motor has a mechanism for automatically turning off the current in case of a sudden stoppage of the machinery by accident, thus doing away with the danger of burning out the armatures. To still further reduce the danger of this trouble, the wheel in the slope, about which the cable passes, is fitted with immense steel springs, so that if the cable should get caught or anything else happen to cause a strain, there will be a play of about 18 inches before anything would break or the strain become too great on the motor. The plant is one of the best and most complete in any coal mine in that section of the country.

Another Substitute for Rubber.

The Mexican Press mentions a plant called "guayule" as a substitute for rubber. Carlos Aguirre, general representative of the company La Anglo-Mexicana, says that the company made numerous experiments in extracting from the shrub the gummy substance it contains and transforming it into rubber. When the success of these experiments was assured, the necessary patents were obtained and a small factory was established at Jimulco, state of Coahuila, which for about a year has been in operation, and $150,000 Mexican currency has been invested. The erection of several similar works in the frontier states is now contemplated. One of these plants is expected to furnish employment to about 500 men, and "guayule" to the value of about $100,000 Mexican currency has been contracted for.

The Sargent Complete-expansion Gas Engine.

The first successful double-acting tandem gas engine, and the first and only one to expand the burning charge to practically atmospheric pressure, to vary the point of cut-off of the admission inlet with the load and to advance the time of ignition as the mixture gets weaker and the inflammation slower, is said to be the Sargent engine, which is illustrated herewith. The advantages thus secured are increased efficiency, increased regularity in speed and smooth running under early cut-offs. The general design of this engine, as shown in Fig. 1, is such that all the strains come in a straight line, yet the free expansion of the cylinders and rods is provided for.

In the ordinary gas engine, the piston at full load draws in a cylinder full of combustible mixture, which, after compression and ignition, is expanded to the original volume and released at a pressure of 40 to 50 pounds absolute, and a temperature of from 1,500° to 1,800° F. In the Sargent gas engine the admission of gas and air at full load is cut off at from five-eighths to three-quarters of the admission stroke, depending on the fuel used, which, after compression and ignition, is expanded to the cylinder volume and is released a little above atmospheric pressure with a corresponding temperature of about 400° F. The point of cut-off, while constant for the full and most economical load of the engine, is made earlier by the governor as the load gets lighter or later as the load gets heavier, giving a large degree of flexibility.

No throttling action of the incoming charge, with its corresponding loss of efficiency, is possible, and, owing to the more complete expansion of the burning gases turning the heat into work instead of throwing it away in the exhaust, a lower terminal temperature and consequently a lower average temperature of the cylinders is maintained throughout the cycle. For this reason, engines of this type below 100 horsepower require no water-cooled pistons or rods.

The mechanism of the engine is as follows: A side shaft is driven by the crank shaft and governor through a pair of worm gears running in oil, carrying two cams for each explosion chamber, one for the igniter and one to operate the valve. These comprise all the moving mechanism except the valves and lever, as shown in Fig. 1, the other side of the engine being perfectly plain.

Fig 2 shows a section through the valves of one of the explosion chambers. By removing six nuts the valve bushing and valves can be removed from the cylinder for regrinding or inspection.

Gas is piped to the chamber (A) in the subbase and air to the chamber (B), which pass through the cylinder supports to the chambers (A') and (B'), ready to pass into the mixing chamber when the cam depression (MN) passes the roller and the ports (F) in the piston valve register with the ports (E) and (D) in the bushing. When the piston valve goes down to this position, the confined air in the piston valve dash pot forces open the poppet valve, thus giving free admission to the charge. When the point (N) of the cam reaches the roller, it is forced down, while the other end of the lever goes up, carrying the piston valve which cuts off the admission. The poppet-valve seats and both valves remain in normal position during compression, ignition, and expansion, or until the point (L) on the cam pushes the roller down and the piston up, which opens the poppet, and the exhaust gases pass out through the ports (K) and the elbow (W) to the exhaust pipe under the floor.

The poppet valve seals the opening in the combustion chamber during compression and inflammation, and the piston valve holding against no pressure, works loosely in its bushing, cutting off the admission and guiding the exhaust. As the poppet valve controls both the inlet and outlet gases, both the valve and seat keep cool and need to be ground not over once or twice a year. The mechanism is simple, and as the roller is always bearing on the cam, the valve motion is practically noiseless.

By revolving the piston valve by the index wheel, the blind port (S) varies the mixture to suit the gas, whether it has 100 or 1,000 British thermal units per cubic foot.

The speed of the Sargent engine is controlled by the well-known Rites inertia governor in the flywheel, which advances the valve shaft, in time, ahead of the crank shaft as the speed increases, thus diminishing the mean effective pressure with the load. As the load gets lighter, the cut-off becomes earlier, taking less of a constant mixture of gas and air into the cylinder, but as the burnt products in the clearance do not lessen, the mixture grows weaker and slower burning. If the ignition were at the same point as at full load, the highest pressure would not be obtained till the piston approached the middle of the stroke, where the cooling surface is so increased that the greater part of the heat goes into the water jacket rather than into the work. In the Sargent engine, the time of ignition advances with the cut-off, getting earlier as the mixture gets weaker, thus maintaining the highest pressure at the beginning of the stroke, irrespective of the load.

While the governor controls the speed through all ranges of load, the gas engine, like the steam engine, is not economical with very light loads. Where a variation in the turning moment is not objectionable, one or more of the explosion chambers may be cut out at will by the engineer, by simply raising to horizontal position a controlling lever which holds the exhaust open and the gas and air closed. This is very desirable in blowing engines, as they can be designed so that two explosion chambers will furnish air at 15 pounds and the four chambers at 30 pounds pressure. If at full load the engine is cutting off at three-quarters stroke an overload may be taken care of by a later cut, though at a decrease of efficiency.

The cylinders are oiled by a force feed pump or check-valve lubricators. The valve gets sufficient oil from the cylinders. The side shaft and out bearings are self-oiling. The cross-head guides, pin crank, pin and main bearings, which must be thoroughly lubricated at all times, are copiously oiled by the worm gears, which act as a pump.

Two electric igniters are placed in each explosion chamber in such a position that they are surrounded with a pure mixture at the time of ignition. Either will fire the charge, and should either become short-circuited the engineer is immediately advised.

The engine is started by compressed air. The pressure of the air when turned on at one cylinder puts the starting mechanism into operation and at the same time puts the cylinder out of service as a gas engine. When the engine is up to speed, turning off the air puts the gas engine into commission without changing a valve, cam or lever.

The Sargent gas engines are manufactured by the Wellman-Seaver-Morgan Company of Cleveland, Ohio.

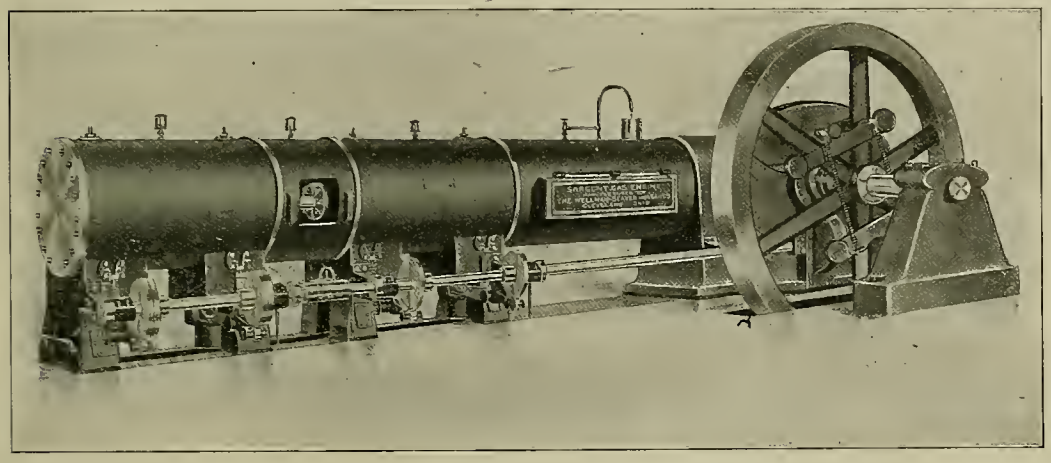


Fig. 1. General View.

SARGENT COMPLETE-EXPANSION GAS ENGINE.

Fargo Rejoices Over Its Street Railway.

The electric street-railway system in Fargo, N. D., built by the Fargo and Moorhead Street Railway Company, was formally opened to the public recently. The largest parade ever seen in Fargo followed the first modern electric car around one of the city loops. The line extends to the Agricultural College and to Moorhead, and is considered one of the finest systems in the Northwest. General Manager Heath and President L. B. Hanna were in charge of the opening ceremonies. It is said that 10,000 persons paid fares on the cars in one day shortly after regular service was begun.

H. F. McGregor of the Houston Electric Company of Houston, Texas, has been in Corpus Christi, Texas, looking over this city with a view to establishing an electric railway.

Some Refinements of Mechanical Science.[1]

By Ambrose Swasey.

For the subject of my address I wish to speak of a few of those methods and mechanisms which have been developed and perfected to such a degree of refinement that they may be considered as almost beyond the practical, and yet were it not for such refinements they could not possibly be made to serve the utilitarian purposes which make them of such inestimable value to us all.

The division and the measurement of time is today, as it has been for ages, among the most important of the subjects affecting the welfare of mankind, and as time has rolled on and there has been a better understanding of the laws governing the universe, nearer and nearer has been the approach to perfection in the working out of these difficult problems, but the many limitations surrounding them have always kept their full solution somewhere in the future.

The diurnal revolution of the earth, which gives the solar day, and the revolution of the earth around the sun, the solar year, are the arbitrary divisions of time marked off with the utmost precision by the celestial bodies; and while the length of the solar day has, from before the Christian Era, been fairly well defined, the length of the solar year was but approximately known until within a few hundred years.

The length of the year, as counted by the Julian calendar, was too long by 11 minutes and 14 seconds, and this error amounted to 10 full days in the 1,600 years from the time the Julian calendar went into effect, until the introduction of the Gregorian calendar.

A few years ago, when visiting the Vatican Observatory, I was particularly interested in the Gregorian Tower, which forms a part of the Vatican Library Building. After passing through a number of rooms which are used in connection with the observatory, when near the top of the tower, I was taken into the spacious and beautiful calendar room, the walls of which are covered with paintings of the highest order, executed centuries ago, under the direction of Pope Gregory XIII. In the center of the room, and forming a part of the floor, there was a large marble slab, on which was cut a fine line exactly in the true meridian, and upon the line was a special mark which indicated the altitude of the sun at noon of a certain day. On the south wall, near the top of the room, there was a small aperture through which the direct rays of the sun passed at noon, projecting a bright spot on the meridian line.

All of this had been planned and executed by the astronomers in order that they might demonstrate the necessity of reforming the calendar, and when at noon on the 23d of March, 1582, Pope Gregory saw that the altitude of the sun as shown by the beam of light, was not for that particular day, but for the day 10 days previous, he directed that 10 days be stricken from the calendar, and that day should be the 11th of March, instead of the 23d.

With such precision had the astronomers determined the true length of the year, that our present calendar with its intercalations will continue on for 20,000 years, with an error not to exceed a single day.

The line on the marble slab and the aperture through the wall of the calendar room were devices simple in the extreme, and in this day of instruments such a method would hardly be considered, yet they served their purposes admirably, and the placing of that line on the true meridian, with an accuracy never before attained, was considered one of the greatest scientific achievements of that age.

Since an unknown time the day has been divided into 24 hours, and as civilization has advanced, the greater has been the necessity for the utmost precision in the measurement of each hour, with its subdivisions.

The sun dial is not only the earliest, but the most interesting of all the numerous arrangements that have been devised for measuring the divisions of the day. Notwithstanding its limitations, it has been a subject which has attracted the brightest minds for ages. Within these later years there has been a renewed interest in this ancient time-keeper, not only in copying the types of dials, which are valuable because of their antiquity, but in working out new forms. Recently a new dial has been invented, by which the rays of the sun will indicate the true mean time for each day of the year, with an error not to exceed one minute.

The hour-glass, which came later, was considered a much more practical method, inasmuch as it could be used either day or night, and because its use was not confined to a particular location; however, as a timekeeper it was not satisfactory, even in those early days.

The clepsydra or water clock, which is supposed to have been invented by the Greeks, was found to be a much better timekeeper than either the sun dial or hour-glass, and it was a great step in advance toward the accurate measurement of time.

These water clocks are to this day used extensively in the East, more especially in China. Those first used by the Greeks consisted of two water jars so arranged that the water from the upper ran into the lower, and the time of day was determined by measuring the depth of water in the upper jar, and at sunrise each day the water was returned to the upper jar. In the city of Canton there is a water clock which has been running for 800 years, and at the present time it is the standard clock of that city.

This clock consists of four water jars, each having a capacity of eight or 10 gallons. The jars are placed one above the other, in the form of a terrace, the three upper ones being provided with a small orifice near the bottom, through which the water drops into the jar next below, and so on down from one to the other, until the water reaches the lowest or registering jar. In this there is a float, to which is attached an upright, having graduations for the hours and parts of hours, and as the water rises the time can be determined by noting the height of the float in relation to the cross-bar at the top of the jar.

In this improved form of water clock the variation in the flow of water due to the difference in height, is overcome by having a series of jars, the outlet of the upper being so gradnated that there is but little variation in the height of water in the second jar, and in the third the height remains practically uniform, thus insuring a constant head for the water which drops into the registering jar. At the beginning of each day the water is taken from below and carried up a flight of steps to the top.

That such an arrangement has some elements favorable to the accurate measurement of time, there can be no doubt. It certainly has the element of simplicity, and notwithstanding its long service, the only wear noticeable, was confined to the steps leading to the upper jar.

Clocks of the present type, although used as far back as the twelfth century, and possibly earlier, were but fair timekeepers, until several centuries later. Those which the astronomers used in their observatories at the end of the fifteenth century were so unreliable that modified forms of the clepsydra of the ancients were used, and, as they did not prove to be satisfactory, most of the observations were made without the use of clocks.

Galileo's beautiful discovery of the isochronism of the pendulum from the swinging chandelier in the church at Pisa was of great value in many respects, but in none more so than in its application to the measurement of time.

Soon after that great discovery the English clockmaker, Graham, invented the mercurial pendulum, by which the variation in its length caused by the difference in temperature was fully compensated, and some years later Harrison, another English clockmaker, invented a compensating pendulum, which consisted of a series of metal bars having different coefficients of expansion—so that 200 years ago, as it is today, the pendulum was the nearest perfect of all the devices that have been employed for governing or controlling the motions of a clock mechanism.

Every part of the clock, down to the minutest detail, has been the subject of study and improvement, and they are made and adjusted with such precision and delicacy that in testing them the question is, Within how small a fraction of a second will they run? Not content with their marvelous performance when under normal conditions, some of the finest astronomical clocks are surrounded by glass or metal cases, in which a partial vacuum is maintained, and in order that the cases may not be opened or disturbed, the winding is done automatically by means of electricity, the frequency of the winding in some cases being as often as once every minute. These clocks are set up in especially constructed rooms or underground vaults, where they are free from jar or vibration, where the temperature and barometric conditions remain practically constant, and where every possible precaution is taken to further minimize the errors of the running rate. A clock in the observatory at Berlin has run for several months, under these favorable conditions, with a rate having a mean error of but fifteen one-thousandths of a second per day and a maximum error of but thirty one-thousandths of a second per day.

Another clock installed at the observatory of Case School of Applied Science at Cleveland, running under similar conditions, also has a mean error of fifteen one-thousands of a second per day, with a maximum error for several months of but twenty-two one-thonsandths of a second per day.

These are notable examples of the present state of the art of clockmaking, and show the wonderful precision with which minute intervals of time can be measured.

From the time of the invention of Peter Hele, in 1477, of the "Nuremburg animated egg," or "pocket clock," which required winding twice a day, and varied an hour and a half in the same length of time, the development of the watch has kept pace with the "mother clock," and followed closely to it in timekeeping qualities.

These marvelous little machines, whether made at the homes of the peasants among the hills and mountains of Switzerland, where the skill required for making a single part has been handed down from generation to generation, or made in the great factories of this country, where fully 2,000,000 high-grade movements are turned out annually, and where the skill of the workmen has been supplemented by modern methods and machinery, are, notwithstanding the difficulties attending their manufacture, produced so cheaply as to be within the reach of almost everyone.

The larger watch, or ship chronometer, with its escapement so delicately made and adjusted that it must always be kept in the same position, was greatly improved through the efforts of the British government in 1714 by offering rewards of 10, 15 and 20 thousand pounds to any who should make chronometers that would run so accurately that the longitude of a ship at sea could be determined within 60, 40 and 30 miles, and Harrison, the inventor of the compensating pendulum and the compensating balance, which is now used in watches, succeeded in making a chronometer, which, after being tested on a long voyage, was found to run so closely that the position of the ship was determined within 18 miles, and he was therefore paid the full award of 20,000 pounds. The historic chronometer, which marked a new era in navigation, is now numbered among the treasures of the Greenwich Observatory.

Modern ships are equipped with chronometers so accurate and so reliable, and with sextants of such precision that navigators can determine their position in latitude and longitude within a few miles. Therefore, with the increased speed of the powerful ships carrying hundreds or even thousands of passengers, together with their valuable cargoes, the methods and instruments used in navigation have been so improved as to greatly diminish the dangers in crossing the seas.

The perfection attained in the measurement of time, which is of such great practical value in nearly every sphere of life, would not have been possible were it not for the even greater refinements that have characterized the methods and instruments used by the astronomer in determining the length of the day and of the year, which are the fundamental standards of time.

The division of the circle and the measurement of angles have ever been among the unsolved problems of the astronomer, yet in the instruments used by him, circles have formed a most important part.

Long before the telescope was invented, Tycho Brahe, the Danish astronomer, "the founder of modern astronomy," constructed for his observatory instruments of various kinds having graduated circles and arcs of circles. His instruments for the most part were improvements on those used by Arabian astronomers in the eighth and ninth centuries, and these, in turn, were copied after similar instruments used by the Greeks and Egyptians, a thousand years previous, and it is supposed that such instruments were used by the Chinese at an even earlier period, so that graduated circles have come down to us from the far-off ages.

The longer the radius the more accurate the graduations, was the principle upon which the early instruments were made. The Arabians, in about the year 1000, built a sextant with a 60-foot radius and a quadrant with a 21-foot radius, but to Tycho Brahe is due to credit of constructing instruments having circles, much smaller in diameter and graduated with a greater precision than ever before. It was by the use of such improved instruments of his own making, and by his observations which were made without a telescope or any means of magnification, that he was able to give the positions of a large number of stars within less than one minute of arc from the positions given by modern astronomers.

The graduation of an eight-foor mural circle in 1725 by Graham of England for the National Observatory, and of an eight-foot quadrant by Bird, in 1767, were notable steps in advance in the division of the circle and the measurement of angles, but these and similar instruments, although their efficiency was greatly augmented by the use of the telescope, have been supplanted by others more practical.

The first circular dividing engine was made in 1740 by Henry Hindley of New York for cutting the teeth of clock wheels, and it is interesting to note that in the same year Huntsmann, another clockmaker of Sheffield, invented the process of making crucible steel, that he might have a metal suitable for the springs of his clocks.

Of the several engines constructed later, the one most successful and representing the greatest proggress, was that made by Ramsden in 1777. This engine, automatic in its movements, was made especially for graduating circles, and because of the great precision with which he divided the circles of the instruments used by the government, the Board of Longitude awarded him the sum of 615 pounds. A further and most potent recognition of the excellence of his work lies in the fact that all subsequent circular-dividing engines have followed closely the same general principles of construction embodied in the Ramsden engine.

It is most gratifying to all those who are interested in mechanical progress that the Ramsden engine has been preserved throughout all these years, and it now stands in the museum of the Smithsonian Institution at Washington as a monument to the one who made it and as the best example of that time of the art of graduating circles.

Many excellent dividing engines have been made that are quite sufficient in point of accuracy for the work for which they were intended, but the perfection required in the graduation of circles for astronomical instruments is such that it has been found to be one of the most difficult of all mechanical problems to make an engine that will meet such requirements.

1. Presidential address at the New York meeting (December, 1904) of the American Society of Mechanical Engineers.

In such an engine the chief essential is that the spindle carrying the master-plate shall be as nearly round and as closely fitted in its bearings as is possible, for the degree of excellence with which that work is done determines how closely a circle can be divided.

It seems almost incredible that a well-lubricated spindle of four inches in diameter at its largest part and tapering three-quarters of an inch to the foot can be made so nearly round and so closely fitted in its bearings that a movement of one-thousandth of an inch in or out of its bearings will in one case cause it to turn with difficulty, and in the other with perfect freedom, yet this has been found to be within the limits of mechanical refinements.

The greatest accuracy thus far attained in such engines is one second of arc, which arc, with a radius of three miles equals one inch, and at 20 inches, which is the radius of the silver ring upon which the graduations on the master-plate are made, a line one-thousandth of an inch in width is equal to 12 seconds of arc, or 12 times the accumulated errors of any number of divisions, or 20 times the greatest error of any single division.

In automatically graduating a circle it has been found to be impracticable to cut more than six lines in a minute, and it requires about 33 hours to divide a circle into two-minute spaces. As with the running of the finest clocks, the best results can only be obtained when the engine is surrounded with every favorable condition possible. Instead of the large circles and sectors used by the ancients, they have been made smaller in diameter, as the methods for graduating have been improved, until those of the more modern instruments are seldom more than 30 inches, and some of the latest meridian instruments have circles of but 25 inches.

The smaller circles, which can be made and graduated with greater precision than the larger ones, are also less liable to change in form, owing to their weight and the variation in temperature, and with the aid of the reading miscroscope the results obtained would not be possible with the larger circles.

A 25-inch circle read with a microscope having a power of 40, would be equivalent to a circle of about 80 feet in diameter, and a single second of arc as seen through the microscope would be equal to 0.0024 of an inch, a quantity easily subdivided.

A most important adjunct to the astronomer's instrumental equipment is the filar micrometer. With it he determines the errors of divisions, the eccentricity of his circle and measures the angles to within a fraction of a second; and when used at the eye end of the telescope he determines the positions and motions of the stars and the distances and diameters of the planets. In these little instruments, whether of the simple or complex form, the chief requisites are the screw and the cross wires, for upon them the value of the observations and measurements depend.

To make the screw of a micrometer so true that the errors in the threads cannot be detected by its own magnifying power, is an extremely difficult task. These micrometer screws are often made with 100 threads to the inch, and are provided with graduated drums having 100 divisions, the readings being made in tenths of a division.

The cross wires, which are but common spider lines, because of their fineness and the remarkable qualities they possess, are indispensable in micrometric work.

That the repulsive and even dangerous spider has plenty of enemies among the human family, there can be no doubt, yet if the value of the contributions which it has made to the cause of science were generally known, it would surely have a greater number of friends than at present, and most certainly the astronomer will say naught against it, for, after the experience of many years, he has found that the spider furnishes the only thread which can be successfully used in carrying on his work.

The spider lines mostly used are from one-fifth to one-seventh of a thousandth of an inch in diameter, and, in addition to their strength and elasticity, they have the peculiar property of withstanding great changes of temperature, and often when measuring the sun spots, although the heat is so intense as to crack the lenses of the micrometer eyepiece, yet the spider lines are not in the least injured.

The threads of the silkworm, although of great value as a commercial product, are so coarse and rough compared with the silk of the spider that they cannot be used in such instruments.

Platinum wires are made sufficiently fine, and make most excellent cross wires for instruments where low magnifying powers are used, yet as the power increases they become rough and imperfect.

Spider lines, although but a fraction of a thousanth of an inch in diameter, are made up of several thousands of microscopic streams of fluid, which unite and form a single line, and it is because of this that they remain true and round under the highest magnifying power.

An instance of the durability of the spider lines is found at the Allegheny Observatory, where the same set of lines in the micrometer of the transit instrument has been in use since 1859.

The placing of the spider lines in the micrometer is a work of great delicacy, and in some micrometers there are as many as 30, which form a reticule, with lines two one-thousandths of an inch apart, and parallel with each other, under the highest magnifying power.

Step by step, from the methods of the Arabian astronomers to the time of Tycho Brahe and on down to the present day, improvements in the instruments and methods for the measurement of angles have been going on, until astronomers can measure double stars with a separation of one second of arc, and within less than one second they can define their positions in the heavens.

In the realm of the measurements of minute linear distances, and the perfection of curved and flat surfaces, the refinements are even greater than those pertaining to the measurement of time and of angles.

Most important in the linear dividing engine is the screw, and although much had been accomplished in bringing such engines to a high degree of excellence, it was for Professor Rowland to make an engine which has a practically perfect screw; and without doubt it is in all respects the nearest perfect of all the mechanisms that have been employed for ruling lines exactly parallel and equally spaced.

The Rowland engine was made especially for ruling diffraction gratings, which are made of speculum metal, and with it a metal surface has been ruled with 160,000 lines, there being about 29,000 to the inch, and as many as 43,000 lines to the inch have been ruled.

The gratings mostly used have from 14,000 to 20,000 lines to the inch, and with such exactness is the cutting tool moved by the screw that the greatest error in the ruling does not exceed one-millionth of an inch.

The production of these gratings, which has enabled the physicist in his study of the spectrum to enter fields of research before unknown, has not only called for the highest degree of perfection ever attained in the spacing of linear distances, but it has also called for a refinement most difficult in the optical surfaces upon which the lines are ruled. To Mr. Brashear was given the problem of producing such surfaces, and, notwithstanding the many difficulties encountered in working and refining the speculum metal plates, he has made many hundred plates, with surfaces either flat or curved, with an error not to exceed one-tenth of a wave length of light, or one four-hundred-thousandth of an inch.

The established standards of length which are the yard of Great Britain and the meter of France, being made of metal, and liable to destruction or damage, Professor Michelson conceived the idea of determining the length of these standards in wave lengths of light, which would be a basis of value unalterable and indestructible.

For the purpose of carrying out these experiments the interferometer was constructed, an instrument which required the highest order of workmanship and the greatest skill of the optician. Again, Mr. Brashear proved to be equal to the occasion, and made for the instrument a series of refracting plates, the surfaces of which were flat within one-twentieth of a wave length of light, with sides parallel within one second. This was the most difficult work ever attempted in the refinement of optical surfaces.

Professors Michelson and Morley devised a method for using the interferometer for making the wave length of some definite light an actual and practical standard of length. So satisfactory was the result that Professor Michelson was invited to continue the experiments at the Bureau of Weights and Measures, at Sèvres, France, where the standard meter, which is kept in an underground vault and inspected only at long intervals, was used for that important work, which occupied nearly a year. The final result of the experiments shows that there are 1,553,164.5 wave lengths of red cadmium light in the French standard meter, at 15° Centigrade. So great is the accuracy of these experiments that they can be repeated within one part in 2,000,000. Should the material standard of length be damaged or destroyed, the standard wave length of light will remain unaltered, as a basis from which an exact duplicate of the original standard can be made. These two marvelous instruments, the Rowland dividing engine and the Michelson interferometer, show the possibilities in the perfection of linear divisions and the standards of length.

We have recounted some steps of the progress that has been made in the measurement of time, of angles and of length, together with some of the refinements in these measurements, but we are confronted with the fact that, notwithstanding all that has been accomplished from centuries past down to the present time, that, as ever before, there are many imperfections requiring new problems in mechanical science to be worked out for the further enlightenment and welfare of mankind.

Michigan Electrical Machinery to Be Tabulated.

An electrical club of 40 members, consisting mainly of sophomore and junior engineers, has been organized at the Michigan Agricultural College at Lansing. Besides a regular weekly meeting for the discussion of items of interest in the electrical world, each member will, during the coming vacation, inspect two or three power plants, and the information secured concerning these will be used as a beginning in the matter of an exhaustive tabulation of the electrical machinery used in the various Michigan power plants.

Importer May File Corrected Invoice.

An interesting decision in which the importers' contention was sustained has just been rendered by the board of general appraisers in the case of the Commercial Cable Company against the collector of customs at New York. The goods involved consisted of telegraph instruments imported through the port of New York. Entry was made on a pro forma invoice on April 19, 1904, the importers estimating the value of the merchandise at $1,662. Before any action was taken by the local appraiser toward ascertaining the market value of the goods and prior to liquidation of the entry by the collector, the importers produced an invoice, duly certified by the consul, which was filed with the collector on April 21, 1904. On May 3d following the local appraiser made his return, approving the value named on the certified invoice, and finding that the goods had a foreign market value of about $27 less than that made on the pro forma invoice, but being the value exactly stated on the certified invoice. The collector, however, assessed duty upon the goods on the basis of the valuation shown by the entry based on the pro forma invoice. The importers contended that the assessment should be made upon the valuation as shown by the consular invoice and the return of the local appraiser.

The board sustained this contention and overruled the collector's decision, holding in effect that when entry is made on a pro forma invoice and a bond is given for the production of a consular invoice, as required by section 4 of the customs administrative act of June 10, 1890, the entry remains "open" until the conditions of the bond have been fulfilled or until the bond itself has become forfeited. When the consular invoice is duly produced to the collector and approved by the appraiser the entry should be liquidated on the basis of the value shown by the consular invoice rather than of the pro forma invoice.

It is now settled beyond question that, in a proper case, an importer has the right to file a corrected invoice in place of one that he finds to be incorrect. T.

Waterpower Possibilities in Texas.

Waterpower in Texas in many localities is only partially developed, according to a report recently made by Mr. Thomas U. Taylor of the United States Geological Survey. There are, however, many plants in the state which have been built upon scientific principles, with modern machinery, and which obtain high efficiency. A large percentage of the plants now in existence are located on Guadalupe, Colorado and Brazos rivers and their tributaries. Guadalupe River easily takes rank as the most effective of the power-generating streams in the state. There are more power plants on Neches and Sabine rivers and their tributaries than on the rivers farther west, but these plants are usually only small mills of six to 30 horsepower, which are used for ginning cotton, sawing lumber, or grinding corn.

In Eastern Texas the country is heavily wooded and is traversed by many small streams which are for the most part tributaries of Sabine River or Neches River and are not subject to sudden fluctuations in height. The water is held back by the leaves, roots and low-growing vegetation which cover the earth and it flows off gradually, so that there is little occasion for shutting down plants on account of low water. The power plants in Western Texas are larger, but the streams are subject to sudden rises and falls, especially the streams that flow through the mountains of Edwards Plateau, such as the Colorado, Guadalupe and Nueces.

Mineral Products of the United States.

The United States Geological Survey has issued a chart which gives in tabular form the quantity and value of the United States mineral products, annually, since 1894. The total value of metallic products alone in the calendar year 1903 is given as $624,318,008, as compared with $642,258,584 in 1902. Of the metals and minerals, excepting iron, entering into the electrical industry to a considerable extent, the following table shows the quantity and value of the products in 1894, compared with 1903:

	1894.		1903.	
	Quantity.	Value.	Quantity.	Value.
Copper, pounds	364,866,808	$33,141,142	698,044,517	$91,506,006
Lead, short tons	159,331	9,942,254	280,000	23,520,000
Zinc, short tons	75,328	5,288,026	159,219	16,717,995
Aluminum, pounds	550,000	316,250	7,500,000	2,284,900
Platinum, troy ounces	100	600	110	2,080
Mica, pounds	.....	52,388	90,100* / 1,693†	17,128 / 41,990
Uranium and vanadium, short tons	.....	.....	19	5,625

*Sheet, pounds. †Scrap, tons.

The Cunard Line steamer Campania reports that on a recent voyage she was in wireless communication with 12 ocean liners, 10 of which were bound for America and two for Great Britain. When 1,200 miles out the Saxonia, the Ivernia and the Campania were in communication at the same time.

Recent Advances in Applied Electrochemistry.[1]

By Dr. K. Elbs.

Electrometallurgy.

Copper.—The total amount of electrolytic copper produced in the year 1903 was probably about 318,000 tons, of which the United States made 86 per cent., Great Britain nine per cent., Germany three per cent., and France two per cent. During the previous year from the 278,000 tons of pure copper manufactured in North America some 800 tons of fine silver worth $13,000,000 and 7,500 kilograms of fine gold worth $5,000,000 were recovered. G. Kroupa has found that American anode slime contains on an average 50 to 75 per cent. of silver, 0.014 to 0.686 per cent. of gold and 10 to 40 per cent. of copper. The largest factories there turn out as much as 27 wagonloads of copper per day, together with about 300 kilograms of silver and five or six kilograms of gold. The slimes are either worked up by furnacing or in the wet way by extracting the silver and copper with sulphuric acid and then decomposing the silver sulphate with metallic copper. The electrolytic processes which have been proposed for the treatment of copper ores have not proved satisfactory on the large scale, e. g., those suggested by Höpfner and by Siemens and Halske.

Nickel.—A strictly electrolytic method of winning nickel from its ores has not been devised; but T. Ulke has worked out a process for separating nickel and copper, which is practicable, though not altogether new. An alloy, preferably consisting of about 80 per cent. of copper and 20 per cent. of nickel, is prepared from the ore and used as an anode against a copper cathode in a bath of copper and nickel sulphates strongly acidified with sulphuric acid. The anode dissolves, fine copper falls at the cathode and the bath gradually becomes stronger in nickel. A portion of the electrolyte is removed from time to time and replaced by a solution of copper sulphate which need not be pure as long as it is rich in that metal. From the liquid which has been withdrawn either the copper is precipitated as sulphide or the nickel as nickel ammonium sulphate, the nickel being thrown down electrolytically from its ammoniacal solution by means of lead anodes. Borchers and Günther have sugested a similar process and have proposed that during the electrolysis of the nickel white lead or chrome yellow should be made by the Luckow method. For the refining of nickel D. H. Browne uses a hot solution of nickel chloride containing common salt at the works of the Canadian Copper Company, which were removed from Cleveland some time ago to be erected on a larger scale elsewhere.

Mercury.—The only novelty to be recorded is the proposal of H. Becker's to obtain the metal by distilling a mixture of cinnabar and chalk in the electric furnace.

Zinc.—S. S. Sadtler has proposed to obtain a liquid by acting upon a mixture of zinc and zinc sulphide with a strongly alkaline solution of sodium hypochlorite, from which pure zinc may be won by electrolysis. The idea does not appear very promising. A. Salgués has suggested the treatment of zinc ores in the electric furnace, and the process is in operation in the Ariège. No technical opinion has been passed upon it, but in view of the great heat losses in the ordinary metallurgy of zinc, Salgués' process may well prove successful.

Iron.—Stassano has an arc furnace running in Upper Italy upon the pure ores found there which is showing a thermal efficiency of over 60 per cent. The furnace is one of 500 horsepower, taking an alternating current of 2,000 amperes at 170 volts and giving an arc one meter long. At present the yield has the qualities of Martin steel, but by further improvements it seems possible that a crucible steel may be obtained. Keller is using two superposed furnaces, the upper one being a resistance furnace in which the ores are reduced, and the lower one being employed for refining the metal. At La Praz, Héroult is obtaining tool steel of the best quality by smelting a mixture of cast-iron and steel scrap in a furnace shaped like a Bessemer converter, with the aid of two alternating arcs of 4,000 amperes at 60 volts, the output per run being three tons. A similar furnace is being erected in Sweden on the railway between Granbergsdal and Kortfors. Kjellin is making crucible steel of the best quality at Gysinge in Sweden in a furnace which contains no electrodes. An alternating current of high tension but small in volume is led to the furnace, which acts with the molten metal in it as a step-down transformer. The charge consists of one ton of a mixture of charcoal iron and mild steel. This furnace is running regularly and enlargements of the plant are contemplated. The electrical smelting of iron ores can only be successful commercially where coal is dear, waterpower present and the ores are good and cheap; but, on the other hand, it appears as if steel may be profitably made electrically alongside the blast furnace, the dynamos being driven by gas engines fed with the waste gases from the blast furnaces.

Potassium.—A method has been worked out by Lorenz, Clark and Sacher for avoiding the trouble usually experienced from the vaporization of the potassium at the temperature of the bath. Dry caustic potash is fused in an iron vessel and electrolyzed between a sheet-iron anode and a cathode of iron wire. The latter passes through the bottom of a hollow inverted cylinder of magnesite, the mouth of which dips below the surface of the electrolyte. When the cylinder is nearly full of metal it is allowed to cool somewhat, plunged into petroleum and broken. The current efficiency is about 58 per cent. Sodium can be advantageously made in a similar fashion, but not barium from its oxide. The process is not suitable for the electrolysis of chlorides, as the cylinder quickly becomes injured.

1. Extracts from a report in the Chemiker-Zeitung.

Manufacture of Compound Bodies in the Furnace.

Calcium Carbide.—Some of the carbide factories which are unable to find a market for their product have introduced the manufacture of ferro silicons containing from 25 to 75 per cent. of silicon; others, such as those at Landeck and Matrei, are producing silicon-copper containing from 35 to 50 per cent. of silicon. A more promising outlook for this industry lies in the preparation of calcium cyanamide. When calcium cyanamide, $CaCN_2$, is treated with steam under pressure it is decomposed into calcium carbonate and ammonia. When it is extracted with hot water a white crystalline mass is obtained on cooling, which consists of dicyandiamide $(CN_2H_2)_2$; and when this is fused with sodium carbonate the chief yield is sodium cyanide and ammonia. Small quantities of of tricyantriamide $(CN_2H_2)_3$, or melamine, are also produced, but these can also be worked up into cyanide and ammonia. Calcium cyanamide is quite free from poisonous properties. As mentioned elsewhere, calcium cyanamide can either be prepared by heating previously made calcium carbide to redness in presence of atmospheric nitrogen or in one operation by fusing lime and coke in presence of nitrogen in the electric furnace. The former material contains about 20 to 22 per cent. of nitrogen; the latter about 12 to 14 per cent.. Together with the process for making nitric acid elaborated by Oswald, which consists in leading a mixture of ammonia and air over glowing platinum and the partially successful method of causing the oxygen and the nitrogen of the air to unite under the influence of an electric spark, we have now means of preparing ammoniacal and nitric nitrogen compounds from the air, which will be ready for adoption on the large scale before the Chilian deposits of sodium nitrate are exhausted.

Siloxicon.—By heating silica and carbon in an electric furnace, Acheson has prepared a new material bearing this name, which appears to possess all the refractory and chemically indifferent properties found in carborundum. Its formula is C_2Si_2O, or C_7Si_7O, and it is obtained when the amount of carbon in the charge is insufficient to insure complete reduction of the silica, and at a lower temperature than that necessary for the formation of carborundum.

Manufacture of Compound Bodies, etc., by Electrolysis.

Hydrogen, Oxygen and Ozone.—At the present time some 28,000 tons of caustic potash and 5,000 tons of caustic soda are being produced in Germany alone every year by electrolysis of their chlorides, and during the process 625 tons, or 7,000,000 cubic meters of hydrogen are evolved. This cannot be allowed to escape into the factories, for fear of explosions, and it is usually led through pipes into the air, and blown to waste. Naturally the expenses of storing, compressing and forwarding the hydrogen to a consumer are heavy; and in many places it may be cheaper to obtain the gas by direct electrolysis. Nevertheless, the hydrogen obtained as a by-product in the alkali works, might be more generally employed than it is. Since 1899 the works at Griesheim has been supplying all the hydrogen required for filling Count Zeppelin's airship (which holds 10,000 cubic meters); and the factory at Bitterfeld has sent its hydrogen to the military aeronautical department at Berlin. The laboratory at Griesheim also uses hydrogen instead of coal gas. The gas is so light, and diffuses at such high speed, that it is less likely than coal gas to form explosive mixtures with air when it escapes; besides which its flame is hotter, and, containing no sulphur, it does not injure platinum crucibles, nor introduce errors into analytical results. The purification of potable water by means of ozone is fulfilling all expectations. An official report from the Department of Public Health states that the cost is 0.7 pfennig per cubic meter.

Alkali and Chlorine.—A patent has been taken out by the Austrian Verein für Chemische und Metallurgische Produktion, of Aussig, which gives several details respecting the "bell" method of making caustic not previously published. It is stated that the anode carbon should nearly fill the bell, so that the fresh chloride solution run into it can only have a narrow space to flow downward in, thus mixing more thoroughly with the rest of the anode liquid. There must be a certain fixed relationship (depending on the area of the bell) between the distance from the lower surface of the anode to the lower edge of the bell, and the amount of alkali in the cathode liquid which constantly flows away. O. Steiner has carried out some systematic experiments upon the same process. He finds that when run continuously, the bell process shows a current efficiency of 85 to 94 per cent., gives an alkaline liquor containing 120 to 130 grammes of KOH per liter, and a chlorine of 97 to 100 per cent. purity, and requires a current density of two to four amperes per square decimeter of horizontal bell area at a tension of 3.7 to 4.2 volts. Up to a maximum of 130 grammes of KOH per liter, the current efficiency is almost independent of the strength of the final liquor. Steiner also finds the statements made in the patent just mentioned, to be correct.

Hypochlorites.—The plan of adding the chloride of an alkaline earth metal to the chloride solution from which hypochlorites are to be made, has been known for some time; its efficacy depends on the formation of a film of hydroxide upon the cathode, which acts as a diaphragm, and diminishes cathodic reduction. Recently the company, formerly Schuckert & Co., has improved the idea by adding resin or a solution thereof to the electrolyte. There can be no doubt that it is cheaper to manufacture a certain quantity of "active" chlorine in the form of bleaching powder, as is done when caustic is made, than to install special electrolytic apparatus for the production of an equivalent amount of bleaching liquid from common salt, according to the well-known methods. Nevertheless, the preparation of the latter liquid is simpler, cheaper and cleaner than the solution and filtration of bleaching powder, while the operation of bleaching with the liquid is more rapid, and generally more complete; hence the special apparatus is serviceable, and, indeed, preferable, for cotton and linen and in steam laundries.

Chlorates.—As it has been found desirable to keep the chloride solution slightly acid, Lederlin has patented a process for adding a small quantity of hydrochloric acid to the chloride bath at intervals, while Threlfell and Wilson have patented a plan of using a subsidiary cathode behind a diaphragm, and diverting a portion of the current to it, so that the liquid near the anode may be kept acid. The National Electrolytic Company has a method of keeping the electrolyte at the necessary temperature by means of the current itself, and causing the liquid constantly to circulate outside the cell, where the chlorate is recovered by cooling and consequent crystallization.

Permanganates.—The factory at Griesheim has an electrolytic process of manufacturing manganates or permanganates of alkaline earth, earth or heavy metals from the corresponding compounds of the alkalis and the respective chlorides, which give as by-products alkali, hydrogen and oxygen or chlorine.

Persulphates.—According to Levi, alkali persulphates can be easily prepared without a diaphragm in the presence of some chromate. The liquid does not require such rigorous cooling, although above 30° C. the yield diminishes seriously.

Chromates.—The factory at Griesheim has patented two processes for the simultaneous manufacture of alkalis and alkali chromates. In one a salt solution is electrolyzed with an anode of chromium or an alloy thereof; in the other a mixture of a chromium and an alkali salt is electrolyzed with insoluble electrodes and a diaphragm.

Lead Compounds.—Ferchland has a process for making lead peroxide from an aqueous solution of the nitrate. Lead sponge separates at the cathode, lead peroxide at the anode, in coherent plates. The electrolyte becomes acid, and is neutralized by adding lead oxide or carbonate. The lead sponge is easily converted into oxide by heating it in air, and the oxide goes back into the bath. Hartmann has patented a modification of the Luckow method of making white lead, the utility of which appears doubtful. Instead of the lead cathode, which falls to pieces and contaminates the white lead with lead sponge, he proposes to employ a cathode of copper oxide, which is converted into metal, but remains coherent.

Organic Compounds.—Hofer and Moest have described (and the latter has patented) a process for obtaining alcohols by the electrolysis of aliphatic salts, in presence of perchloric acid with indifferent electrodes; sodium acetate, for instance, gives up to 90 per cent. of the theoretical yield of methyl alcohol. A patent has been taken out for the reduction of nitrobenzene to azoxybenzene, by suspending the former in aqueous potash, using a large cathode and a small anode, without a diaphragm. At the boiling point Meister, Lucius and Brüning find that the yield is chiefly azobenzene. Boehringer and Söhne find that nitro compounds can be reduced to amines electrolytically when suspended in alkaline or saline liquids, as well as in acid ones, a copper cathode being employed, and powdered copper being added. When the amine is not attacked by the alkali, the yield is almost quantitative, and the process can, therefore, be combined with a production of free alkali and chlorine. According to a subsidiary patent, the cathode need not be of copper, if powdered copper is used. Various other methods of preparing amines by electrolysis have been patented. During the last year 4,000,000 kilos of electrolytic chlorine were consumed in the manufacture of monochloracetic acid alone, this compound being employed in the synthesis of indigo.

It is reported that a trackless trolley street-railway system has begun operation in Berlin, Germany, with apparent success. The vehicles resemble electric omnibuses, but derive their power from an overhead trolley. They have a speed of 10 miles an hour and are equipped with a special type of wheels to prevent stoppages by snow.

CORRESPONDENCE.

Great Britain.

London, December 3.—The industrial depression which has existed to some extent in Great Britain during the last 18 months has defied a satisfactory explanation from many persons. It is not often, however, that responsible persons talk about this matter. Mr. Walter Emmott, chairman of the Leeds section of the Institution of Electrical Engineers, had something to say on this question in his address last week, and his views are those of a manufacturer. His opinion is that the cause of the depression has not been due to any want of energy on the part of those responsible for the industry, nor has it been due to any strained relations between capital and labor. In his opinion, this depression has attacked practically the whole of the civilized world, and is due to circumstances beyond human control. Had it been confined to Great Britain alone, we might have concluded that it was due to foreign competition. He had carefully studied all the returns and had confirmed his opinion that our safety lay in maintaining a firm grip on those departments over which we now had control, with a view to at least holding our own. In this connection he maintained that the effect of a complete system of standardization on the various engineering industries cannot be overestimated.

Despite the competition of the corporation, the National Telephone Company's subscribers in Glasgow have increased during the last year. The Swansea municipal telephone undertaking for the first year shows a revenue of nearly $20,000. At Portsmouth the corporation has now 2,000 subscribers' instruments connected up, and what is more—an unusual feature in municipal work of any kind here—the work has been carried out within the original estimates of cost.

It was reported in the daily papers this week that the Marconi people had succeeded in transmitting a wireless message from Cornwall to Italy, and that the Italian minister had replied to it by the same means.

An important result of the electrification of the Liverpool-Southport section of the Lancashire and Yorkshire railway is that a through service of trains can now be run over the system of the Liverpool overhead railway, thus making a direct connection with the Liverpool docks, which has hitherto been impossible. On the question of the electrification of steam railways, it is interesting to note that good progress is being made with the scheme of conversion for the lines of the Great Western Railway Company near London. A 10,000-kilowatt power station is to be erected, tenders for which have been let, as well as for the cables.

During the severe snowstorms last week while, on the one hand, several trolley tramway systems were dislocated through damage to overhead equipment, the surface-contact tramways at Wolverhampton were dislocated, owing to the thickness of snow and ice upon the contact studs.

The new alternating-current motor meter, which was placed on the market in England by the Aron Meter Company a short time back, is meeting with much favor, according to the report of the directors for the year, and the company's business generally in Great Britain has assumed a brighter aspect.

During the week several additional tube-railway schemes for London have been deposited with Parliament, one of them competing with the west-to-northeast route for a good part of the way. A strong opinion exists that these proposals should be allowed to come before Parliament, whether the Royal Commission on London Traffic reports or not this year, and unless this wish is acceded to it will be the second time in three years that promoters of tube-railway schemes in London have been put to the expense of promoting their lines and then having to abandon them for the year.

The question of gas engines for central-station work seems again to be attracting attention in Great Britain. One address to a local section of the Institution of Electrical Engineers and also a paper have already dealt with this matter. One opinion is that the present restricted development in the employment of gas engines has not been due to inability on the part of the gas-engine makers to make large engines, but more from the fact that power gas plants have not reached the necessary requirements of a large supply with a capital outlay in first cost and efficiency to compete with a large steam-raising plant.

The treasurer of the Royal Society has received a sum of $5,000 from an anonymous donor, to be devoted to the advancement of science. Two thousand five hundred dollars of this is to be placed to the credit of the catalogue of scientific papers account of the Royal Society and the remainder to the credit of the National Physical Laboratory account. G.

New York.

New York, December 10.—The event of the week, following up the resignation of Chief Engineer W. B. Parsons, has been the announcement of the retirement of J. B. McDonald, the bidder and constructor of the subway. He denies that his retirement is due to friction with August Belmont and refuses to admit that he will be the builder of a proposed Metropolitan subway should Mr. Vreeland obtain a franchise for an independent tunnel. The New York Tribune states that Mr. McDonald received $800,000 for assigning his contract to the Interborough company. A probable successor for the place vacated by Mr. McDonald is James H. Hyde, the vice-president of the Equitable Life Assurance Company, who has just been elected a director of the Rapid Transit Subway Company and the Interborough Rapid Transit Company. Mr. Hyde has large interests in both companies.

The question of the successor to Mr. Parsons is under discussion. The logical candidate would perhaps be George S. Rice, deputy chief engineer. He has been working on subway matters for several years and was formerly engineer of the Boston subway. Other candidates for the position are General Francis Vinton Greene, ex-police commissioner, and Mr. S. L. F. Deyo of the Interborough company.

The subway has passed with credit through its first ordeal of the rush entailed by a snowstorm. The first storm of the season in New York happened on Tuesday and led to a great rush for the dry tunnel. From 4:30 to 6:30 p. m. the subway trains were crowded to their utmost capacity, about 20,000 passengers having got aboard at City Hall. While there were blockades on many surface lines the traffic on the subway went through without a hitch.

The Interborough company has purchased, or is about to purchase, the franchise of the so-called "Steinway" tunnel under the East River, through which it is purposed to run trolleys from Manhattan to Long Island City. Amicable arrangements have been made not to clash with the Pennsylvania railroad tunnel now constructing.

The growing feeling against the overcrowding of surface cars was voiced in the New York Tribune of Thursday last by a letter from Mr. L. Duncan Bulkley. During a snowstorm he avers that there were but few cars running, and that on one of them he heard the conductor ring up 142 fares besides accepting many transfers.

After nearly a year's preparation the Rapid Transit Commission has issued its report on New York city traction for 1903. Plans and pictures elucidate the current problems.

The city budget for 1905 provides for an expenditure of $4,978,752 by the water and lighting department. Of this amount $122,230 is allotted to salaries for lighting and electricity and $3,422,438 for lamps, electricity and gas. Alderman Doull, a former secretary of the department of water supply, gas and electricity, stated before the City Council on Tuesday that gas was obsolete for the purposes of city lighting and predicted that in a few years only electricity would be used. He argued that if the city intended to erect its own lighting plant it ought to confine itself to the setting up of an electric-lighting plant capable of lighting only streets and public buildings.

Alderman Haggerty has framed a voluminous ordinance now under consideration by a committee, providing for rules and regulations for the installation of electric wiring for lighting, heating, machinery, fixtures and all electrical appliances in buildings and other structures within the city of New York. The proposed ordinance covers everything from power stations to electric fans, and if passed will involve the appointment of a large corps of electrical inspectors.

The Brooklyn Rapid Transit Company is making enlargements and improvements in the various stations of the Fifth Avenue and Bay Ridge elevated lines, at a cost of $250,000. The union station at Thirty-sixth Street will be enlarged and reconstructed; extra platforms and two new tracks will be built; the stations on the Fifth Avenue line will be lengthened to accommodate six-car trains, and large shops and a storage yard are to be built at the terminal. The same company is about to increase its service of express trains.

The Atlantic Avenue tunnel, Brooklyn, connecting with the Long Island railroad, is likely to be completed by the first of next June. The progress made by the contractors has been rapid and the work schedule first proposed will be kept. The entire track between the terminus of the improvement at Atkins Avenue and Jamaica has been laid with 100-pound steel rails, and the ducts for the electric feed cables are laid out as far as Jamaica.

G. F. Swinnerton, A. Fogshay and R. K. Thompson have incorporated the Queens-Nassau Electric Light and Power Company, with a capital of $100,000, to serve suburban Brooklyn. Headquarters will be at Valley Stream, L. I.

The John W. Wallace Company of 396-400 South Second Avenue, Brooklyn, is in the market for a number of individual electric motors for its sheet-metal plant. Steam is the present motive power. Its machinery includes a large die punch working with a pressure of 100 tons and said to be the largest of its kind in the world. This company has a new compound sheet metal from which it stamps out solid preserving pans, etc. This composite, which is made by a secret process, consists of 80 per cent. steel, with 10 per cent. facings of nickel and copper on the opposite sides. D. W. W.

New England.

Boston, December 10.—The Boston and Maine Railroad Company has put into effect after a conference between the management and the telegraphers in the road's employment, a new schedule of wages and working hours which is virtually an increase of pay for this class of employes of the road to the extent of adding about $37,000 to the corporation's annual expenses.

Work will be begun soon on the new two-mile stretch of Boston elevated road, which will extend from Dudley Street, the present terminus, to Forest Hills. The railway company is therefore in the market for about 10,000 tons of structural steel. The surveys were made some time ago. The railroad commission's assent has also been asked for by the company in order that the tracks in the new East Boston tunnel may be approved and accepted for use.

A controlling interest in the Fall River Automatic Telephone Company changed hands on Wednesday of last week. The purchasers are said to have been John T. Swift and certain associates. It will be continued as an Independent company, it is understood, and the officers will be retained for the present. E. B. Jennings is president, B. D. Davol treasurer, and the other directors are Quinlan Leary, R. F. Haffenreffer, Jr., Martin Feeney, A. P. Mathewson, R. J. Thompson, Michael Sweeney and Vinton A. Sears, the last-named of Boston.

The annual report of the Boston Elevated Railway Company for the year ended September 30, 1904, has just been made public. Operating expenses were $8,631,553, against $8,259,860 the previous year, an increase of 4.4 per cent.; net earnings, $3,759,799, against $3,699,654 the previous year, an increase of 1.6 per cent.; surplus applicable to dividends, $829,771, against $826,954 the previous year; passengers carried, 241,681,945, against 233,563,578 the previous year.

Ex-Alderman Harry B. Masters died suddenly at Brockton on Wednesday of last week while telephoning from the office of the Standard Oil Company to his home. Accounts of the accident are meager; a man in the office at the same time said afterward that he was so horrified when the fatality occurred that he hardly knew how it happened. He thought Mr. Masters sat down the telephone desk set after using it, and before letting go took hold of the electric-light switch to extinguish the light and so made a connection through his body. Mr. Masters had a firm hold of the electric-light fixture when he fell and the wire became twisted about his wrist. B.

Dominion of Canada.

Ottawa, Ont., December 10.—There are 300 men working on the Marconi wireless station at Port Morien, N. S. One of the towers is now up to a height of 70 feet, two of the others are about 30 feet high, while the fourth tower is only just commenced. The station is not expected to be completed before May or June next, when it will be opened by Mr. Marconi in person.

The members of the finance committee of the City Council of Kingston, Ont., have for six months been negotiating with various telephone companies. The council has now indorsed an agreement for an exclusive franchise to the Bell company for five years. The city is to receive $700 per year, free use of poles for fire-alarm wires, telephones to citizens at $30 for business places and $25 for residences, two party lines for residences at $18 each, and four at $15 each. The company also agrees to erect a fine office building and install metallic lines with latest improved instruments.

The town of Westmount, a suburb of Montreal, having a population of about 10,000, by vote has decided to own a plant to produce electric light, independent of the Montreal Light, Heat and Power Company. This action is in direct opposition to the power company, which obtained control of the field through an amalgamation of previously opposing concerns. A similar antagonistic feeling is said to exist in the city of Montreal.

The Ottawa civic committee which has been looking into the purchase of the electric street railway of the city for the sum demanded by the Ottawa Electric Company, viz., $3,000,000, has recommended that a by-law be prepared for submission of the project to the property owners of the city at the municipal election to be held in January next. The recommendation provides that the system be operated by a commission composed of the mayor and two citizens, not members of the City Council, to be elected for terms of not less than three years each, by the property owners, until the original debt on the undertaking is paid off. It is probable that the proposal will be ratified by the property owners, although there is considerable opposition manifested.

The latest scheme for power development along the Niagara frontier is decidedly unique. It has for its foundation the turning back of the waters of the Chippewa River, making its present source its mouth, and its outlet into Lake Ontario instead of into the Niagara River, as nature has fixed it. The proposition is to have the river empty into Lake Ontario, a short distance from Jordan Station, in Lincoln County, Ont. Those who are promoting the project say that their whole undertaking will be a comparatively easy one from an engineering standpoint. With the course of the Chippewa reversed, advantage can be taken, for power purposes, of the 300-foot drop between the level of the Niagara River, above Niagara Falls, and the level of Lake Ontario. It is claimed that the opportunities, above the Falls, for harnessing the forces of the combined lakes

are practically exhausted, while only a small portion of the estimated horsepower of the great cataract has been utilized. W.

Southeastern States.

Charlotte, N. C., December 10.—The Piedmont Electric Company of Anderson, S. C., has been chartered by the secretary of state, with a capital of $25,000. E. S. Moore is president and treasurer and E. F. Brown, secretary.

The Parr Shoals Power Company of Newberry County, S. C., has been commissioned with $50,000 capital to do a general power business. Those interested are M. G. Houseal, C. H. Cannon and K. W. Sligh of Newberry and C. L. Scott of Greenville.

The Parr Shoals Power Company of Newberry has been granted one year additional time in which to complete work on the road, the limit now being January 1, 1906.

The Board of Aldermen of High Point, N. C., will shortly consider a proposition to sell the electric-light plant, which, it is said, has not proved a paying investment to the city.

The Charleston and Summerville Railway Company of South Carolina, with $1,000,000 capital, has just been chartered to build an electric line between the points named. J. J. O'Connor, George S. Legare and others are interested. The state has also commissioned the Charleston and Summerville Electric Railway Company, in which A. J. Warner of Gainesville, Ga., is interested. While it is stated that the last-named concern will go to work on its plans at once, the first-named, the Charleston and Summerville Railway Company, has not announced its future plans.

The Virginia Automobile Company of Norfolk, Va., has been chartered to build and lease automobiles, etc. Moses Nusbaum is president and the capital stock is $25,000 maximum.

The city light plant at Tarboro, N. C., was recently destroyed by fire, the loss being $3,000.

The city of Asheville, N. C., is considering the problem of installing an electric-light plant at a cost of from $25,000 to $50,000 by converting the old pumping station into an electric plant.

The Atlanta and Carolina Railway Company has been formally organized in Atlanta, Ga., to build an electric line from Atlanta to Greenville, S. C. The capital stock has been raised from $50,000 to $2,000,000. John R. Hosch has been elected president, M. T. Edgerton secretary and Jos. A. McCord of Atlanta, treasurer. The company has right-of-way, it is understood, in a number of counties and to Anderson, S. C.

The light, water and sewerage commission of Griffin, Ga., has awarded contracts to the General Electric Company of New York for the electrical work in improving the electric plant.

Plans have just been completed for the $120,000 office building for the Georgia Railway and Electric Company in Atlanta. The structure will be three stories high and will be used as the general offices of the company.

The Raleigh-Durham (N. C.) Passenger and Power Company has been chartered by the secretary of state for the purpose of constructing an electric line from Raleigh to Durham, 28 miles, and to build two belt lines in Raleigh, and also power and light plants for the two cities. W. J. Nellms, who established the Newport News-Old Point Comfort system in Virginia, is one of the principal incorporators. L.

Ohio.

Cleveland, December 10.—It is stated that preparations are under way for the extension of the Toledo, Fostoria and Findlay from Fostoria northward, where it will connect with another line at Pemberville. At Woodville the connection will be with the Lake Shore Electric, by which either Cleveland or Toledo may be reached.

A franchise has been granted the Hamilton Heating and Power Company by the city of Hamilton to furnish current for light and power to consumers. The company agrees to pay one per cent. of its gross earnings into the city treasury in return for the right to operate in the town.

The Cincinnati Traction Company will entertain its 2,800 employes, with their families, on December 29th at the Music Hall. A large Christmas tree will be provided and amusement will be furnished for both old and young.

The case of the city of Toledo against the Toledo Railways and Light Company relative to universal transfers has been appealed from the Lucas County Circuit Court to the Supreme Court. The decision of the lower court was to the effect that the city could exact transfers only where the roads continued in the same general direction and that a variance of more than 45 degrees relieved the roads from obligation to give transfers.

Arrangements are said to have been completed for a reorganization of the Miami and Erie Canal Transportation Company. Several meetings have been held recently at Cleveland and Akron.

Bids will be received shortly for wiring the penitentiary for electric lights and furnishing current for the same purpose. It is not known whether a plant for that purpose will be installed.

The Newell Street Railway Company, East Liverpool, has been incorporated with a capital stock of $10,000. W. B. Hill, W. E. Wells and others are interested.

All the double-truck cars of the Cleveland Electric Railway Company will be equipped with air-brakes, according to a decision arrived at a few days ago. There has been quite a little discussion regarding the matter of late, and to avoid any further comment the action has been taken. O. M. C.

Indiana.

Indianapolis, December 10.—The Lebanon-Thorntown Traction Company has been incorporated for the purpose of constructing a railway system in Lebanon and Thorntown and connecting the towns with an interurban line, 16 miles in length. It is understood that the Indianapolis and Northwestern Traction Company is back of the project. H. M. Atkinson, A. C. Darley, R. E. Niven, R. P. Wood and F. M. Reed are the incorporators.

The Huntington, Columbia City and Northwestern Electric Railway Company has been incorporated to build and operate an electric railroad between and connecting the cities of Huntington, Columbia City, Syracuse, North Webster, Vawter's Park, Goshen, South Bend and Lagrange. The principal office will be in Columbia City. W. F. McLallen, L. D. Clapham and others are interested.

An amended petition for a franchise to come into the city of Indianapolis has been filed by the Indianapolis, Newcastle and Winchester Traction Company. The company wants to build a spur in Peru Avenue and construct a freight house there. The petition is signed by D. M. Parry, president.

The steam railroads entering Indianapolis have entered into an agreement, it is said, not to deliver any freight to electric lines. It was thought that a railroad is as much bound to deliver freight to one carrier as to another, and if the railroads are under no such legal obligation, the incoming Legislature will be asked to impose such an obligation by law. Shippers say there is no virtue in the claim of the steam roads that there is no traffic agreements or relation between the steam and the electric roads.

Engineers are making a survey of the Tippecanoe River near Monticello for the purpose of locating and building three dams to utilize the waterpower in generating electricity. The company expects to light the city of Monticello and also have sufficient power to operate an interurban railway to pass through this section of the country.

The Matthews Electric Light and Power Company has been incorporated to build and operate an electric-light plant in Matthews. The capital stock is $15,000. Philip Hughes, E. W. Trook and G. S. Reinholt are the incorporators.

The Dunkirk Lighting Company has filed articles of incorporation with the secretary of state. The capital stock is $21,000. The company proposes to build an electric-light plant in Dunkirk. The incorporators are Jesse M. Soper, C. H. Harkins and C. O. Reynolds, all of Chicago. S. S.

Michigan.

Detroit, December 10.—Members of the Street Railway Employes' Association of Detroit have started a campaign to induce the Detroit United Railway to arrange some method whereby the vestibules of the cars may be uniformly heated. Under existing conditions, they claim the motormen endanger their health in the performance of their duties.

It is reported at Marshall that the Michigan Central Railroad Company is making an effort to purchase the property of the Jackson and Battle Creek Traction Company, the third-rail electric road from Battle Creek to Jackson, and the trolley line from Battle Creek to Kalamazoo of the Michigan Traction Company. The road between Kalamazoo and Battle Creek is 24 miles long. The one between Battle Creek and Jackson is one of the best electric roads in the country. It has cut into the Michigan Central's business, between the two points, both in the passenger and freight business.

Manager McGuigan of the Grand Trunk Railroad Company does not hold out very bright prospects for electric traction in the St. Clair tunnel at Port Huron. He said: "Electric engines, such as are used in the Baltimore and Ohio tunnel, could only handle 40 per cent. of the St. Clair tunnel traffic." The new electric locomotives of the New York Central are apparently overlooked.

Capitalists from the East were in Battle Creek last week to finance the interurban railway connecting Grand Rapids, Battle Creek and inland lakes. The right-of-way is secured, except a franchise for Battle Creek, so that rails can be laid in the spring. Battle Creek has been holding up a franchise until it could see the glitter of the real gold.

The Battle Creek and Coldwater Electric Railroad Company recently refused the franchise ready for its final passage by the Coldwater City Council, but an amended franchise was passed in form acceptable to the company. The company will deposit a certified check of $5,000 with the city clerk, guaranteeing the construction of the road within two years between Union City and Coldwater.

According to the tests may by Prof. Henry S. Carhart, the street lights furnished by the Washtenaw Light and Power Company of Ann Arbor were from eight to 18 per cent. below the contract standard, but the company readjusted the circuits according to his suggestions, and the lights are now up to the contract requirement. Charges were made in the council that the company was not furnishing as much light as it was being paid for, and Professor Carhart was engaged to make a thorough test of the system.

The Detroit, Ypsilanti, Ann Arbor and Jackson railway general offices have been moved from the Majestic Building, Detroit, to the old Worden homestead, Ypsilanti, and opened in the new location last week. The only Detroit offices of the company in the future will be the freight and passenger offices maintained jointly by the suburban roads.

The Detroit United Railway, Jefferson Avenue branch, has moved into the new offices and barns at Jefferson Avenue and St. John Road, Fairview village. When the work is all done there will be 11 storage tracks 750 feet long.

The Detroit Press has started a movement to give to street-railway conductors an extra cent when paying the fare, the amount thus collected to be divided at the end of the day between the motorman and the conductor. This plan, if carried out during the holiday season, would yield quite a comfortable sum for each man, and yet would not be a tax upon any street-car rider.

The Edison Illuminating Company of Detroit is preparing to discontinue the use of steam power in its Washington Avenue station, which will be used as a sub-station, operated by the high-pressure current from the Delray plant. When the changes are all made the main offices will be moved downstairs to the ground floor and the entire front half of the building made into offices. The rear half of the ground floor will be used for the rotaries for serving the downtown district.

It is reported in Detroit that the electrical supply dealers of that city belonging to the National association have formed a combine and raised the price of electrical supplies from 25 to 30 per cent. Capt. Frank J. Miner of the firm of Seidler-Miner Electric Company was interviewed and characterized the story of a combine as an absolute falsehood. He said: "We do belong to the national association, but this association is only for the advance of the electrical trade in bringing out new devices and keeping abreast of the times. As for the raise in price of electrical goods, there has been none. Electrical supplies have never been so cheap as this year. The only thing raised was rubber-covered copper wire. This, however, is due to the raise in the rubber and copper market of the last 15 days, and is true all over the country. The manufacturers are forced to increase the price to us and we have to raise it to our customers in proportion." C. G. W.

Northwestern States.

Minneapolis, December 10.—The Minnesota Power and Trolley Company has asked the Minneapolis City Council for permission to erect poles and string wires within the city for lighting and power purposes. It is proposed to offer electric light and power in competition to the Minneapolis General Electric Company.

Plans have been prepared by Oscar Claussen of St. Paul, Minn., for a complete plant for electric-railway, light and power purposes for the Mankato (Minn.) Railway, Light and Power Company. Bids for the construction are to be taken soon.

It is reported that the Electric Power Company of Somerset, Wis., contemplates developing power from one of the rivers near Balsam Lake.

The Yankton (S. D.) Electric Light Company has ordered a new street-lighting system which will cost about $2,000.

R. H. Burton-Smith is promoting a new interurban-railway project with Sioux City, Iowa, as one of the terminals. He is said to have strong backing.

The new electric-lighting plant at Wilmot, S. D., has been completed.

The Mankato Street Railway, Light and Power Company has advertised for bids for the erection of a large power house at Mankato, Minn. It is expected that the construction of a street-car system there will be pushed to completion without further delay.

F. C. Sigler has purchased the Osceola (Iowa) electric-light plant.

George T. Reddington, city clerk of St. Paul, Minn., will receive bids until December 20th for furnishing the street lighting for 1905.

The trustees of the Wells estate have asked for a franchise for an electric-light and heating plant at Milwaukee, Wis.

The Apple River Power Company has completed its new plant at Riverdal, Wis.

The Twin City Rapid Transit Company has notified the St. Paul council that the company will positively not agree to the five per cent. gross-earnings' tax or to the council having the right to regulate fares. A committee has been appointed to confer with the company and, if possible, to bring about an amicable settlement of the litigation which has been carried on for several months.

Guy Robing has been granted a franchise to establish an electric-lighting system at Grey Eagle, Minn. Work on the new plant will be commenced at once.

Citizens of Monticello, Iowa, are considering the advisability of organizing a company to build an electric line from Muscatine to Dubuque.

Curtis & Chase have purchased the electric-light plant at Leon, Iowa.

The Anoka (Minn.) Waterworks, Electric Light and Power Company will add a new 2,000-light dynamo to its equipment.

The trolley line from Waterloo to Sumner, Iowa, will be extended to West Union.

An electric road will be constructed next year from Valley Junction, Iowa, through Winterset to Creston.

The Milwaukee (Wis.) Electric Railway and Light Company proposes to build a railway to Horlicksville.

The trolley line from White Bear, Minn., to Wildwood has been completed by the Twin City Rapid Transit Company.

A company has been formed with $250,000 capital for the purpose of building a trolley line from Council Bluffs, Iowa, through Carson to Des Moines. H. H. VanBrunt of Council Bluffs is president and W. F. Pierce of Carson secretary. R.

Rocky Mountain States.

Salt Lake City, December 8.—The Lewiston-Clarkson Company of Lewiston, Idaho, is preparing to make some extensive improvements in that vicinity, including the establishment of electric power plants, the building of a reservoir and the construction of electric railroads. The money for the contemplated improvements was raised through an issue of $2,000,000 of bonds. Work on the construction of the electric plants and reservoir has already been commenced.

Work on the electric road between Salt Lake City and Ogden, Utah, is progressing rapidly, and in the mean time negotiations have been entered into with the Utah Light and Railway Company to string its wires as far as the northern boundaries of the county. The extension of this system of the Salt Lake and Ogden Railroad Company to Layton will be undertaken early next year, according to a recent statement of the management.

The management of the Cœur d'Alene and Spokane Railway Company of Spokane, Wash., is projecting the construction of a branch line to Rathdrum, Idaho, work on this enterprise to be commenced next year.

An auxiliary plant of the Utah County Light and Power Company of American Fork, Utah, will be established in the near future for the purpose of furnishing power for the mines of Bingham, Alta, Big Cottonwood and other mining camps in that vicinity. The proposed plant will have a capacity of 1,500 horsepower. The estimated cost of the plant s $150,000.

The initial run over the electric railroad of the Nevada Transit Company between Reno and Sparks, Nev., was made a few days ago. This is the first and only electric line in existence in the state.

The Tonopah Light and Power Company of Tonopah, Nev., is installing a new plant at its station to provide electric lights for the city.

Surveys have been completed for the construction of an interurban electric railroad between Salt Lake City and Bingham, Utah, and the management of the Salt Lake and Utah Valley Railway Company gives assurance that the work of construction will be commenced within the next few months. When completed this will be part of the first interurban electric-railroad system in Utah. G.

Pacific Slope.

San Francisco, December 8.—Oscar L. Smith, who is interested in the new electric line to connect Reno and Sparks, Nev., is in San Francisco on business connected with the work.

The Electrical Supply Company has been incorporated at Sacramento, Cal., with a capital stock of $10,000, which is mostly held by C. V. Schneider.

Weidenthal & Gosliner are to install the electric-wiring and telephone system in the building being constructed on Powell Street, near O'Farrell. The cost is to be $1,100.

The California Electrical Works has just received an order for 200 series-alternating arc lamps to be used by the Pacific Light and Power Company at Los Angeles. The Los Angeles Railway Company has given this electrical-supply firm a large order for Thomas high-tension insulators, to be delivered at once.

Among the estimates of the Navy Department for improvements at Mare Island are $15,000 for the enlargement of the electric plant and $10,000 for additions to the electric workshop.

The San Francisco Gas and Electric Company is installing a 1,400-horsepower direct-current generator of the General Electric type at Edison station on Jessie Street and the station is being enlarged. Station "B" on Townsend Street is being gradually put out of commission and there is but little apparatus there now outside of the old arc machines.

The Electrical Supply Company has filed articles of incorporation at Sacramento, Cal., with a capital stock of $10,000. The directors are H. G. May, F. R. Ellison, Fred Meyer, J. C. Hobrecht and C. V. Schneider.

A corps of engineers has been at work for several days running a new route for the proposed electric-railway system about Yakima, Wash., to tap the Sunnyside country. This is the project being pushed by Robert Strahorne of the Northwest Power and Light Company of Spokane, Wash.

The county commissioners of Snohomish County, Wash., have granted to W. M. Snyder and J. W. Hall of Snohomish a 50-year franchise for an electric road from Monroe through the Sultan basin to the "45" mine.

The Washington Central Railway Company has been incorporated at Chehalis, Wash., with a capital stock of $500,000. The incorporators are George E. Long, M. D. Sayles and L. E. Crouch of Portland, Ore. The corporation will acquire, construct and operate a railway, telegraph and telephone line from a point on Grays Harbor near Grays Harbor City to the foot of Priest Rapids, Yakima County, Wash., and a five-mile branch line starting about five miles from Centralia, Wash.

The Edmonds Electric Light and Transportation Company of Seattle, Wash., has completed all preliminary arrangements for tapping the surrounding timber belts with a network of electric lines. The company expects to have the first section of railroad completed by May 1st, and ultimately to open all the territory to the east of Edmonds for a distance of 35 miles. The power house is to be completed by May 1st. A.

PERSONAL.

Mr. S. Morgan Bushnell of the engineering staff of the Chicago Edison Company has just returned from a two-months' trip to Europe, taken for rest and recreation.

William H. Fennell, in charge of the De Forest space-telegraph station at Kansas City, will go to Cuba, it is said, where the company has a government contract for installing a system.

B. R. Hoffman of Detroit, Mich., has been appointed assistant treasurer and assistant to the general manager of the Detroit, Ypsilanti, Ann Arbor and Jackson Railway Company, with headquarters in the new general office of the company at Ypsilanti.

Frank Murphy of Omaha, Neb., president of the Omaha and Council Bluffs Street Railway Company, and identified with many other leading industries of Omaha, died in New York city on December 12th. Mr. Murphy was rated as one of the wealthiest men of his state.

Albert H. Stanley, formerly general superintendent of the Detroit United Railway, Detroit, Mich., was married on December 5th in Milwaukee to Miss Grace Lowrey Woodruff, formerly of Detroit. Mr. Stanley is a young and able street-railway manager, being at present general manager of the electric lines of Newark, N. J.

C. G. Goodrich, vice-president of the Twin City Rapid Transit Company of Minneapolis, it is said, will act in the capacity of adviser for Judge Grosscup in the hearing of the dispute regarding the merits of 100 new cars recently purchased by the receivers for the Chicago Union Traction system from the St. Louis Car Company.

Mr. A. J. Wurts of the Westinghouse Electric and Manufacturing Company, who recently resigned as manager of the Nernst Lamp Company, has been appointed constructing engineer for the Carnegie Technical Schools of Pittsburg. In accepting this new appointment Mr. Wurts does not sever his connections with the Westinghouse Company, but will continue there in his experimental and development work, which has been so interesting and successful.

Reports from Washington, D. C., are to the effect that Prof. Alexander Graham Bell, who has just returned to his home in that city after several months spent in experiments with his tetrahedral cell kites at Baddeck, Cape Breton, firmly believes he has the fundamental principles of the airship in his grasp. Professor Bell's present plan is to devote his time entirely to the construction of a kite of great size that will sustain itself in a slight breeze.

Of Bertrand B. Abry, a young engineer of the Westinghouse Electric and Manufacturing Company, who died recently, the Electric Club Journal says: "He possessed an engineering mind. This combined with a love of hard work and a determination to get things right, no matter what the cost, made his work not only rich in achievement but full of promise. In the words of one of his older associates, 'he was one of the most promising of our young engineers.'" Mr. Abry, who was but 28 years of age, was a former student of the University of Nebraska and a graduate of the University of Illinois.

Samuel M. Manifold has announced his resignation as general manager for the York County Traction Company, the York Street Railway Company and the Edison Electric Light Company of York, Pa., to take effect January 1st, when he will assume the duties of sheriff of York County. It is unofficially announced that A. H. Hayward, general superintendent of the Dayton, Springfield and Urbana Traction Company, will succeed the retiring manager. Mr. Hayward entered upon his electric-railroad career in Cincinnati in 1882 and was connected with the various suburban street-railway companies in Pennsylvania and New York. About a year ago he was in Argentine and Porto Rico, where he was engaged in electrical construction work.

Prof. Harris J. Ryan, professor of electrical engineering in Sibley College, Cornell University, Ithaca, N. Y., has accepted the directorship of the department of electrical engineering in Leland Stanford, Jr., University at Palo Alto, Cal. The electrical department at Stanford has been in charge of Prof. Albert W. Smith until lately, Prof. W. F. Durand, also of Cornell, temporarily taking the place recently vacated by Professor Smith, who is now at the head of Sibley College, Cornell. Professor Ryan is one of the most prominent electrical educators of the country. He was born at Powell's Valley, Pa., in 1866 and graduated from Cornell after a four-year course in electrical engineering. He was one of the electrical jurors at the Chicago World's Fair of 1893, and is a member of the American Institute of Electrical Engineers, of which he has been vice-president. He is a fellow of the American Association for the Advancement of Science and a member of Franklin Institute. Professor Ryan has presented a number of valuable papers to the American Institute of Electrical Engineers on Transformers and other alternating-current apparatus, dynamo design and cognate subjects. At the recent International Electrical Congress in St. Louis Professor Ryan was one of the official delegates representing the government of the United States. He also had a paper on the "Design of Insulators" before Section B of that body.

HARRIS J. RYAN.

ELECTRIC LIGHTING.

The Witthoff Brick Company of Birmingham, Mo., is in the market for machinery and equipment for an electric-light plant.

The city trustees of Orange, Cal., have voted to call an election on January 7th to vote on the issuance of bonds in the amount of $75,000, $15,000 to be used for an electric-lighting and power plant.

Ford, Bacon & Davis of New York are said to have bought out the Knoxville Street Railway and Electric Light Company at Knoxville, Tenn. Extensive improvements will soon be made.

The Albuquerque Electric Power and Lighting Company of Albuquerque, N. M., has purchased the old electric plant of the Cochiti Gold Mining and Milling Company, which is being removed to Albuquerque.

The Yankton Improvements Company of Yankton, S. D., has been incorporated with capital of $100,000. The company will apply to the Yankton council for a franchise to build and operate an electric-light and gas plant in the city of Yankton.

The city of St. Thomas, Ont., proposes to take over the plant of the Gas and Electric Company, and a board of arbitration is at present engaged in settling a difference of valuation between the city and the private corporation owning the property.

At a meeting of the stockholders of the Electric Light Company at Red Lion, Pa., a vote was cast favorable to accepting the proposition of George Heisey of Lancaster, who offered $11,740 for the plant. Mr. Heisey contemplates placing Red Lion, Dallastown and Yoe on one system, with the construction of a plant large enough to light the three towns.

The council of Chambersburg, Pa., has sold the municipal-light plant to a combination of local capitalists, for which Charles Walter, attorney for the Chambersburg and Gettysburg Electric Railway Company, bid $75,550. The combination agrees to light the streets for $74.50 per light per year, furnish municipal incandescent light at 5½ cents and pay 50 cents a pole and $1 per mile for wire as taxes each year. There is strong talk of invoking the aid of the court to prevent the sale, it is said.

ELECTRIC RAILWAYS.

The city of St. Thomas, Ont., owns and operates the six miles of electric street railway within its corporate limits. The road gives general satisfaction as to service, says United States Consul Burke, but at the expense of a deficit ranging between $3,000 and $4,000 per annum.

The Lambertville, New Hope and Trenton Street Railway Company has completed grading between New Hope and Yardley, Pa. Track is being laid from both ends of the line, and the ballasting is well advanced, while poles are up a good portion of the way.

The McKinley syndicate, which has built an interurban railway from Decatur to Springfield and from Springfield to Carlinville, Ill., and is now building electric roads further south, announces that Edwardsville, Ill., will be the center of construction work and the headquarters for managers, workmen and supplies.

Directors of the Chicago City Railway Company have voted to renew last year's agreement with the union of the train-service employes of the street-car line. General Manager Starring of the company has sent word to the union, division 260 of the Amalgamated Street and Electric Railway Employes of America, that its request for a renewal of the old

contract would be granted if the agreement be made to run till December 31, 1905.

The sale of the San Jose and Santa Clara (Cal.) electric railroad with its Alum Rock Park and Tenth Street branches to J. R. Parkinson of Palo Alto and associates has been confirmed. Mr. Parkinson says that the new company will now proceed to the immediate construction of a standard-gauge line from San Mateo to Palo Alto and thence to San Jose, via Mayfield, Mountain View, Sunnyvale and Santa Clara. The trunk line will also be extended to Gilroy and numerous branch lines are contemplated.

Plans are under consideration by the Erie Railroad Company, the Morristown and Erie Railroad Company, which connects with Erie at Essex Falls, N. J., and the Public Service Corporation of New Jersey to conect Newark by trolley directly with Morristown over the tracks of the Morristown and Erie, which is the extension built by Richard McEwen, a paper manufacturer of Whippany, and his associates from the Essex Falls terminus of the Erie railroad to Morristown. The Morristown and Erie is but 11 miles long, and it is said the road could easily be equipped for electric propulsion by either the third-rail or the overhead system.

The fight for a right-of-way to form a connecting link between the Chicago and Milwaukee electric railroad and lines to the north of Kenosha, Wis., is said to have been completed, a deal having been closed whereby the Chicago and Milwaukee electric road has obtained the absolute purchase of a right-of-way from Waukegan, Ill., to Kenosha. It now only remains for the Chicago and Milwaukee company to conclude negotiations with the company operating electric lines from Milwaukee to Kenosha, when through service may be had from Milwaukee to Evanston, Ill., which will ultimately, no doubt, be extended into Chicago. Whether such negotiations will be concluded or whether the Chicago and Milwaukee road will extend a line of its own on up to Milwaukee, however, seems to be a matter of doubt as yet.

SOCIETIES AND SCHOOLS.

At a meeting of the executive committee of the National Electric Light Association, held in New York on December 6th, the dates fixed for the Denver-Colorado Springs convention were June 6th, 7th and 8th at Denver, and 9th, 10th and 11th at Colorado Springs.

The 192d meeting of the American Institute of Electrical Engineers will be held in the Chapter Room of Carnegie Hall, 154 West Fifty-seventh Street, New York city, on Friday, December 23, 1904, at 8:15 p. m. The following paper will be presented and discussed: "The Maximum Distance to which Power can be Economically Transmitted," by Ralph D. Mershon, consulting electrical engineer, New York and Montreal.

The College of Arts and Engineering of the Polytechnic Institute of Brooklyn has issued its announcement circular of the lectures to be given by its newly organized board of consulting professors. The department of electrical engineering now has the services of Dr. Samuel Sheldon, Mr. Charles F. Scott, Dr. Louis Duncan, Dr. F. A. C. Perrine, Mr. Thomas D. Lockwood, Mr. William S. Barstow and Mr. Sydney W. Ashe. A series of evening lectures is announced as follows: Four lectures on commercial electrical engineering by Professor Scott, beginning December 21st and ending March 16th; eight lectures on electrical-power transmission by Professor Perrine, beginning February 9th and ending May 18th; eight lectures on central-station practice by Professor Barstow, begun December 15th and ending March 14th; eight lectures on telephony, telegraphy and patent practice by Professor Lockwood, beginning February 7th and ending May 15th, and eight lectures on electric traction by Professor Duncan, beginning February 15th and ending May 25th.

PUBLICATIONS.

The Wile Power Gas Company, engineers, of Rochester, N. Y., which makes a specialty of gas producers, has issued its catalogue B, illustrating and describing various types of gas producers.

Gaswork versus guesswork, with a few "Wise Whys" thrown in, is the gist of a folder from the Marinette Gas Engine Company of Chicago Heights, Ill. It is intended for "those who are interested in getting the most for their money," and those who "belong" should write to the company for full details.

What the Yost Electric Manufacturing Company of Toledo, Ohio, has to sell in the line of weather-proof lamp and wall sockets, rosettes, etc., may be found in a little booklet sent out by the company. The booklet, though small, will attract attention and does not leave unsaid any essential things about this particular class of apparatus.

Jandus interchangeable enclosed arc lamps, multiple direct-current lamps, multiple alternating-current lamps, constant-current series direct-current lamps, multiple series lamps for power circuits—all these, with structural details, are described in bulletin No. 20, which may be obtained from the F. Bissell Company of Toledo, Ohio. These lamps are adapted for public and private arc lighting on all circuits.

Mercury-vapor lamps for general lighting purposes and for such special service as photography and advertising are exploited in the latest bulletin of the Cooper Hewitt Electric Company of New York city. The bulletin is devoted to a general description of the lamp and a summary of its most noteworthy applications and is a credit to the company's advertising department even when judged by the standard of past excellence.

Electrical novelties and appliances of the latest type, which, as is well known, may be always obtained from the Ewing-Merkle Electric Company of St. Louis, are set forth in a pleasing manner by the company's latest catalogue, which has just appeared. A feature of this catalogue is the large variety of electrical toys for the holiday trade which are listed. Among the other appliances which are handled by the company may also be mentioned electrical decorative outfits, electric heaters, pocket searchlights, private-line battery-call telephones, etc.

The Erie Railroad Company, in order to give its patrons an idea of the diversity of products which are manufactured at points easily accessible to its lines, has issued a pamphlet giving the names of the manufacturing industries which are located along the system together with their products. A glance through this list will attract attention because of the variety and extent of these products, indicating forcibly the great resources of the country tributary to the lines of the Erie road. A map of the territory covered by the railroad system is also shown and the bulletin will be of much assistance to those who are in quest of a favorable locality in which to locate.

When it comes to the matter of high-class advertising literature the Holophane Glass Company of New York and Chicago is always to be found in the front rank and the two handsome booklets which the company is just now distributing do not discredit the statement. One of these booklets is entitled "The Lighting of the Home," and to say that it is a work of art in this line is not putting the statement too strongly. There are many valuable hints contained in the booklet relating to porch and interior lighting for the home illustrated by handsome pictures. "Light vs. Illumination," the other booklet, is a little treatise on the general subject of scientific illumination.

TELEGRAPH.

The familiar Wall Street rumor of telegraph consolidation is once more afloat. It takes this shape: "The entrance of Kuhn, Loeb & Co. into Missouri Pacific and the arrangement of differences between Pennsylvania and Gould interests will, it is understood, be followed by a merger of the Western Union and the Mackay companies, although the latter consummation may not be arrived at for some little time. It is understood that strong financial interests stand ready to finance the combination whenever details are arranged. That there is room for large economies is clear, since the two systems have been in the most active kind of competition, involving the maintenance of two offices in a great many locations where one would suffice." It is likely that there is nothing more substantial to this report than to previous ones.

A bill has been introduced in the House by Representative Wagner calling for a $2,000,000 appropriation to connect the canal zone of the Ithmus of Panama with the United States by submarine cable. The bill provides for the construction and operation of such a cable under the control and direction of the postmaster-general, the secretary of war and the secretary of the navy, the cable to be of American make and to be laid by American ships, provided the cost of an American-made cable will not exceed the cost of a foreign-made cable by more than 10 per cent. The three cabinet officers are authorized to enter into negotiations and establish cable connection with lines running to Central and South America, the West Indies and islands in the Gulf of Mexico, the Caribbean Sea and the Pacific Ocean.

SPACE TELEGRAPHY.

The space-telegraph station of the De Forest Wireless Telegraph Company at the Navesink Highlands, N. J., was destroyed recently by fire. This is the station which was used in reporting the races for the America's cup during the last international yacht races. The station was fully equipped with receiving and sending apparatus, and was used principally in communicating with the De Forest stations at 42 Broadway, New York city, and the one at Paterson, N. J. The loss was about $3,000, and a new plant, it is said, will be installed.

The Navy Department has authorized the commanding officer at the torpedo station at Newport to accept dispatches to and from ships at sea by way of the Nantucket lightship. Orders are being prepared opening to commercial business the following naval space-telegraph stations: Portsmouth, N. H.; Cape Ann, Mass.; Boston and New York navy yards; Cape Cod; Montauk, L. I.; Navesink, N. J.; Cape Henry, Va.; Dry Tortugas, Fla.; San Juan, Culebra; Yerba Buena, Cal., and Mare Island navy yard. Other stations will be opened in a few weeks.

MISCELLANEOUS.

Union electrical workers of Detroit, Mich., will submit bills at the next session of the Legislature calling for the regulation of the trade by an examining and licensing board and creating some regulations for high-tension wires. The men say they want to raise the standard of the workers by requiring an examination and license.

The trials of the Allan Line steamer Victorian, the largest turbine vessel yet built, which was launched at Belfast August 25th, have been so disappointing, it is said, as to raise serious doubts among the Clyde shipbuilders as to the value of turbines in the case of large ships. All the efforts made to get the Victorian near contract speed were futile.

Patent No. 775,577, "Trolley," which was recently issued to Messrs. Edward L. Naret and Joseph R. Ernst of Morgantown, W. Va., and which was reviewed in the Western Electrician's patent record of December 3, 1904, instead of comprising two wheels, one in a horizontal and the other in a vertical plane, consists of three wheels—one in a vertical plane and the other two in planes approximately 45 degrees to the first. The latter pair of wheels is situated so as to clasp the trolley wire and hold it in connection with the main trolley wheel, being operated by a toggle lever to which the trolley cord is attached.

TRADE NEWS.

The Providence Engineering Works of Providence, R. I., states that it has not decided to undertake the manufacture of the Storey motor. A few weeks ago it was reported that this company had adopted the Storey motor as its standard in its decision to enter the electrical field by manufacturing motors.

A. P. Munning of New York, general sales agent of the Cutler-Hammer Manufacturing Company, has been in the West several weeks in the interests of his company. Mr. Munning says that the demand for Cutler-Hammer electric controlling devices has never been as great as it is now, and he reports a most promising outlook for the coming year.

The Banner Electric and Manufacturing Company has been organized to succeed, it is stated, the Risdon Electric Company of Oklahoma City. The new company is incorporated with a capital stock of $10,000, and the officers are C. B. Luck, Charles Risdon and W. K. Snyder. Messrs. Luck and Risdon will be the active members. Mr. Luck was for several years connected with electrical contractors and telephone engineers in Chicago, and for the last year has been installing the new telephone system at Gainesville, Texas.

The Union Electric Manufacturing Company of Milwaukee reports under date of December 12th as follows: "The Cutler-Hammer Manufacturing Company made a motion in the Circuit Court of Milwaukee for an order of the court compelling us to stop manufacturing and selling the automatic starting boxes we are now putting out, but the court, after a full hearing of the case, refused to grant the order for a preliminary injunction or for contempt. The opinion above was filed today." The litigation referred to is based on the Blades patent.

The Brown Corliss Engine Company of Corliss, Wis., has just received a contract from the city of Milwaukee to furnish and erect at the North Point pumping station one 20,000,000-gallon triple-expansion high-duty crank and flywheel pumping engine according to plans and specifications prepared by the city of Milwaukee, and also according to plans and specifications submitted by the company. The total amount of the contract is $64,500. This pumping engine has been the source of considerable discussion in the last three or four months, and practically all of the prominent engine and pump builders of the country have submitted bids on the work. The commissioners of public works of the city of Milwaukee and City Engineer Poetsch visited the plant of the Brown Corliss Engine Company at Corliss, Wis., and satisfied themselves that the concern is amply able to execute the contract. The company is now at work extending its foundry 60 feet in order to take care of the large amount of work on hand and in view. This contract, in addition to the large $100,000 contract recently secured of the Navy Department and some others of smaller proportion, is gratifying to the young manufacturing concern which has associated with it men of engineering ability and standing.

BUSINESS.

The Columbian Electrical Company of St. Joseph, Mo., announces that it now occupies its new building at 820 Frederick Avenue, which contains about 15,000 square feet of floor space. This increased space will facilitate business in each of the four departments—engineering, mechanical, construction and fixtures.

The National Carbon Company of Cleveland makes the announcement that it received the grand prize at the Louisiana Purchase Exposition for all

of its carbon products, including Columbia enclosed arc carbons and Columbia dry batteries. It is asserted that the Columbia carbons are today used in about 90 per cent. of the enclosed arc lamps in service.

The Speer Carbon Company, St. Marys, Pa., announces that it has secured the right and privilege of attaching copper "pigtail" terminals to carbon brushes for all General Electric Company's machines. The Speer Carbon Company is well equipped for handling anything applicable to the carbon brush; and one of its most important qualifications is its ability to make quick deliveries of "pigtailed" brushes, or, in fact, anything in the line of carbon brushes.

The Electric Controller and Supply Company of Cleveland, Ohio, has just shipped the second of two 200-horsepower 220-volt type M. T. magnetic switch controllers to the Lorain plant of the National Tube Company. They are for the control of the reversing motors driving the tilting tables on each side of the plate mill. These controllers give automatic acceleration, which can be adjusted to the maximum rate consistent with safety to motors and gearing. When reversing from full speed forward to full speed reverse the table is automatically brought to a quick stop and accelerated in reverse direction in the least time interval consistent with safety. The magnetic controller with resistances is placed near the motor, thereby effecting economy in the use of heavy wires. The construction of the magnetic controller, however, is such that no matter how rapidly the operating controller may be reversed the current flowing to the motor is automatically limited to a safe value. The controller is especially adapted to the control of motors of any driving machinery which must be quickly accelerated, but which has such heavy parts that with the ordinary manually operated controller dangerous overloads, with consequent damage to the motor and gearing, are liable to occur. Other recent shipments of controllers of this type have been made to the Carnegie Steel Company and to the Lackawanna Steel Company, also to the Illinois Steel Company.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued (United States Patent Office) December 6, 1904.

776,490. Electrode. Frank J. Briggs, Everett, Mass. Application filed September 19, 1903.

Carbons or anodes are arranged in pairs and provided with heads. A copper ribbon is wound around and connects the heads of the two carbons in each pair. A copper top is adapted to be electrically connected and copper lugs extend down from the top between the heads of the carbons in each pair on one side of the ribbon.

776,491. Temperature-compensating Device for Electrical Measuring Instruments. William H. Bristol, Hoboken, N. J. Application filed February 23, 1904.

In combination with a generator of electricity and a measuring instrument having a low-resistance coil is a temperature-compensating device located in proximity to the measuring instrumeot and containing a mercuric column acting on a resistance in series in the circuit for automatically maintaining constant the total resistance of the part of the circuit comprising the measuring instrument and the compensating device under variations in temperature.

776,514. Cleat for Electric Wiring. Emory C. Hunt, Belle Plaine, Iowa, assignor of one-half to C. W. E. Snyder, Belle Plaine, Iowa. Application filed January 26, 1904.

A base and cap-piece are described, the base having a wedge-shaped forwardly tapering bore passing therethrough, and the cap-piece having a central opening adapted to register with the smaller end of the bore of the base.

776,521. Electric Switch. Walter S. Levin, New York, N. Y. Application filed March 28, 1904.

Contact-terminals, a contact-plate adapted to complete a circuit between the terminals, a pivoted lever carrying the plate and independent of the circuit, a second lever pivoted adjacent to the first lever, a rod carried by and movable longitudinally on the second lever, one end of the rod bearing against the first lever, the rod adapted to be moved from one side to the other of the pivot of the first lever when the second lever is rocked on its pivot, and means for keeping the end of the rod in contact with the first lever and to rock the lever on its pivot as the rod is moved from one side to the other of the pivot are some of the features.

776,522. Electric Switch. George B. Low, Newton Center, Mass. Application filed May 23, 1904.

A base, a pair of non-coriducting blocks secured to the base at a proper distance apart, contact-plates secured to the blocks and electrically connected by circuit-wires, a pair of yielding metal switch-plates secured to the non-conducting blocks, and a rotatable key-slotted sleeve journaled in the base are described.

776,524. Automatic Telephone Exchange. Frank A. Lundquist, Chicago, Ill., assignor to M. E. Richardson, Sterling, Kan. Application filed April 30, 1900.

In a switching mechanism for an automatic telephone exchange are a driving pawl and a holding pawl, a shaft provided with a ratchet wheel normally held in a position so as to be out of engagement with the pawls and means for moving the shaft axially so as to bring the ratchet wheel into line of engagement with both of the pawls. Means whereby further axial movement of the shaft will remove the ratchet wheel from line with the driving pawl without disturbing its connection to the holding pawl are provided.

776,526. Electric Brake for Vehicles. Joseph N. Mahoney, Brooklyn, N. Y., assignor to the American Electric Brake Company, New York, N. Y. Application filed January 21, 1904.

The combination consists of a propelling motor adapted to be driven as a generator by the momentum of the vehicle. Means are provided whereby a controller varies the current in the circuit including the field as the speed of the vehicle varies, to control the current in the electromagnetic brake apparatus.

776,534. Means for Automatically Stopping Electric-railway Cars on Trains. William O. Mundy, Louisville, Ky., assignor to the General Electric Company, Schenectady, N. Y. Application filed September 30, 1902.

A safety-switch controls the supply of current to the control-circuits and a tripping device for opening the switch is located adjacent to the track at a predetermined point. Means are connected with the switch and extend from both sides of the car so as to engage the tripping device when the car is run either end foremost.

776,535. Trolley Hanger. Robert W. McIlvaine, Hamilton, Canada. Application filed March 5, 1904.

A trolley hanger having a rail-supporting element and upwardly diverging suspending rods is described.

776,536. Self-closing Telegraph Key. Noble S. McKinsey and Anton R. Nelson, Susanville, Cal. Application filed December 26, 1903.

Means are provided for normally holding the front end of the key lever down aond the circuit closed. The front end of the key-lever has a vertical tubular guide or bearing and a pin or rod movable therein. The friction of the rod in the bearing is sufficient to sustain the front end of the key in its raised position.

776,546. Brush Holder. Edward D. Priest, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed April 19, 1902.

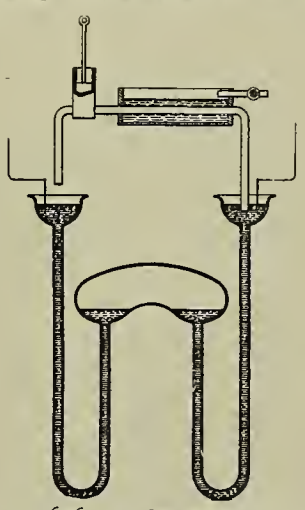
A brush holder has sockets for two brushes, a separate follower for each brush and a single spring acting on both followers.

776,556. Conduit for Electric Wires. Clarence C. Sibley, Perth Amboy, N. J., and George A. Lutz, New York, N. Y. Application filed December 19, 1902.

A metallic conduit for electric wires has a wall provided with a series of countersunk extensions whose walls are slit providing tongues projecting toward a common point and arranged to permit the passage of screws or nails between their ends. The heads of the screws or nails may bear upon the tongues and remain in the countersunk extensions.

776,557. Electric Transmission Mechanism. Charles G. Simonds, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed May 5, 1904.

Two relatively movable shafts in line with each other, and a dynamo-electric machine having its field carried at the extremity of one shaft and its armature carried at the extremity of the second shaft are described. The field has a web extending around the armature and forming a bearing for the second shaft.



NO 776,565.—VAPOR-TUBE RECTIFIER.

776,563. Current Rectifier. Percy H. Thomas, Pittsburg, Pa., assignor to the Cooper Hewitt Electric Company, New York, N. Y. Application filed February 4, 1903. Renewed May 5, 1904.

The method of regulating the density and purity of the gas or vapor in the chamber of a gas or vapor electric apparatus in which one or more of the electrodes is composed wholly or in part of a conducting fluid, consists in circulating through the chamber a portion of the conducting fluid.

776,563. Current Rectifier. Percy H. Thomas, Pittsburg, Pa., assignor to the Cooper Hewitt Electric Company, New York, N. Y. Original application filed February 4, 1903. Divided and this application filed May 6, 1903.

One claim describes an exhaust chamber, a gas or vapor therein, a negative electrode, one or more positive electrodes presenting surfaces within the chamber, at least one of which consists of an enclosed fluid column having an approximately level surface, and means for continuously supplying fresh fluid to the column or columns.

776,565. Current Rectifier. Percy H. Thomas, East Orange, N. J., assignor to the Cooper Hewitt Electric Company of New York. Original application filed May 6, 1903. Divided and this application filed August 23, 1904.

An electrode consisting of a conducting fluid has its outer terminal exposed and subjected to external pressure, the outer terminal being located above the barometric height, whereby a balance is secured between the internal and external pressures by adding to the effect of normal external pressure the weight of a portion of the conducting fluid. (See cut.)

776,633. Lamp Guard. Fred W. Winbolt, Springfield, Mass. Application filed December 26, 1903.

The guard consists of a shell formed of longitudinal wires secured at one end to a closed ring and at the other end to the members of a separated ring. The shell is provided with inwardly projecting means for engaging a lamp bulb at axially separated points in order to support the guard wholly upon the lamp bulb.

776,638. Portable Electric Device. Charles E. Avery, Jersey City, N. J., assignor to the Manhattan Electrical Supply Company. Application filed April 18, 1904.

A circuit-closer for flash lamps and the like comprises a spring conducting arm arranged to establish an electrical connection with one pole of the battery. A resilient tongue is carried by the arm and a lever is pivotally secured to the arm for moving the tongue into electrical connection with the opposite pole of the battery.

776,653. Winding for Electrical Apparatus. Joseph W. Farley, East Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed March 16, 1904.

A coil for electrical apparatus has a number of suitably insulated strands disposed one outside of another and in an unequal number of side-by-side sections or turns, the strands of the middle turn or section being bent across each other so that substantially one-half of each strand occupies a complementary relation to the other half as regards distance from the center of the coil.

776,654. Coil for Electrical Apparatus. Joseph W. Farley, East Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed March 16, 1904.

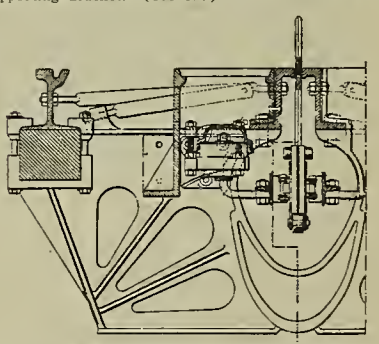
A coil for electrical apparatus comprises two similarly wound sections each composed of a number of suitably insulated strands arranged one outside of another, the strands of one section being joined to those of the other section in reverse order so that the longer and the shorter strands are connected to form turns of substantially uniform length.

776,660. Electric Fuse and Cut-out. Benjamin H. Glover, Buffalo, N. Y., assignor to the Chicago Fuse Wire and Manufacturing Company, Chicago, Ill. Application filed August 13, 1903.

A conductor has a wrapper or envelope having a number of thicknesses and a powdered material between the thicknesses of the wrapper.

776,681. Electric Railway. Richard C. Parsons, Reginald Belfield and William Chapman, London, England, assignors to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed November 16, 1900.

A conduit and a yoke constitute an integral part of the device. A box-like structure is bolted to the yoke and a bracket is secured to the yoke. An insulator is supported by the bracket, a stem passing through the insulator is secured to the top thereof by a nut and projects downward and into the conduit for supporting the conductor rail therein. A cap incloses the top of the insulator for maintaining the insulation between the nut and the supporting bracket. (See cut.)



NO. 776,681.—ELECTRIC-RAILWAY SYSTEM.

776,682. Plow for Electrically Propelled Vehicles. Richard C. Parsons, Reginald Belfield and William Chapman, London, England, assignors to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Original application filed November 16, 1900. Divided and this application filed February 20, 1902.

A current-collecting device for open-conduit electric railways is described, in combination with the portion of a car from which the device is supported and an intervening connecting member that is rigidly fastened to the current-collecting device by soft metal bolts or rivets. The collecting device may become detached by shearing the bolts or rivets when its movement is obstructed.

776,695. Suspension Clamp for Electric Conductors. Edward L. Schwarz and Albert G. Ward, Belleville, Ill. Application filed April 10, 1903. Renewed March 26, 1904.

A clamp for permanently supporting a wire and a temporary support above the clamp and integral with the base thereof upon which a wire may be supported during the operation of suspending a cable therefrom are the features.

776,700. Sparking Device for Internal-combustion Engines. Charles E. Sterne, San Diego, Cal.,

assignor to the Sterne Bros. Company, San Diego, Cal. Application filed May 2, 1901.

A sparking device combining electrodes which are normally out of contact, a rocker-arm for causing a contact, etc., are described.

776,705. Induction Coil. Richard Varley, Providence, R. I., assignor to the Varley Duplex Magnet Company of Providence, R. I. Application filed December 30, 1903.

An induction coil having a number of vibrators therefor and a switch for throwing any one of them into circuit at will form the combination. (See cut.)

776,728. Attachment for Transmitters. William W. Dean, Elyria, Ohio, assignor to the Kellogg Switchboard and Supply Company, Chicago, Ill. Application filed February 6, 1904.

An attachment for telephone transmitters consists of a light open frame adapted to receive a number or other slip and provided with a ring at its inner end to receive the inner end of the mouthpiece by means of which it is clamped in position upon the front plate of the transmitter.

776,735. Trolley-wire Clamp and Feed-wire Support. Thomas A. Furniss, Canonsburg, Pa. Application filed September 7, 1904.

The combination consists of a clamp comprising jaws, a supporting member carried by one of the jaws and cooperating with the other jaw, and means for attaching a wire to the supporting member.

776,752. Power-transmitting Mechanism. William McHaffie, Tenafly, and George D. Beinert, Jersey City, N. J. Application filed September 29, 1903.

In combination with a driven wheel, a movable frame, a driving wheel carried by the frame and movable therewith into and out of engagement with the driven wheel is an electric motor for operating the driving wheel also carried by the frame, a switch for controlling the motor circuit and a common actuator for operating the frame and the switch.

776,789. Insulator. Fred M. Locke, Victor, N. Y. Application filed November 16, 1903.

Two inverted cup-shaped insulator sections are nested together and formed with annular flanges in planes one above the other and at substantially right angles to their axes.

776,803. Trolley-operated Electric Switch. John J. Ruddick, Newton, Mass., assignor to the United States Electric Signal Company of Maine. Application filed March 28, 1904.

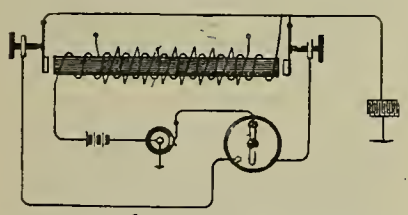
The parts are: A fixed contact member, a movable contact member, a trolley-wire, means for transmitting the movement of the trolley-wire caused by the pressure of the trolley to the movable contact member, and a locking device for the movable contact member, also operated by the trolley-wire. (See cut.)

776,826. Electric Propulsion of Cars or the Like. Orestez H. Caldwell, Indianapolis, Ind. Application filed February 15, 1904.

A stationary electromagnetic field, an electromagnetic field carried by the car and moved by the stationary field, and means for energizing the movable field from the source of energy employed for the energization of the stationary field are described.

776,836. Trolley Track. Charles A. Gower, Lansing, Mich. Application filed July 20, 1903.

The track is composed of two channel-shaped rails having the flanges projecting inwardly with means for retaining them in position without use of bolts or screws.



NO. 776,705.—INDUCTION COIL.

776,849. Electric Switch. William Kingsland, London, England. Application filed March 7, 1904.

An electric switch for alternately making and breaking an electric circuit and for alternately inserting and cutting out resistances by similar consecutive motions of an operating member is described.

776,855. Electric Switch. Ellsworth A. La Har, New Britain, Conn., assignor to the Hart Manufacturing Company, Hartford, Conn. Application filed July 30, 1904.

A face plate having an opening therethrough at a point between the contacts, a shutter to close the opening free to move downwardly between the contacts without touching them, and a contact-carrying plug free to pass through the opening in the face plate and adapted by rotation to connect the contacts in the receptacle are features of the device.

776,866. Electrical Measuring Instrument. Frank W. Roller, Plainfield, N. J. Application filed May 15, 1902.

A device for testing the relative resistance of different portions of a conductor has a portable contact bar carrying a number of terminals adapted to engage the conductor. The contact bar is yieldable and normally tends to assume a position so that its parts are out of alignment.

776,871. Trolley-wheel Oiler. William J. Sloan and John E. Robinson, Cleveland, Ohio. Application filed April 30, 1904.

A pump cylinder and piston is mounted upon the harp, there being circulating passages from the pump through the pin and returning to the pump, and communicating with the trolley-wheel bearing. Instrumentalities are provided for actuating the piston in the cylinder.

776,876. Apparatus for Wirelessly Transmitting Electrical Energy. Daniel W. Troy, Montgomery, Ala. Application filed March 19, 1903. Renewed October 26, 1904.

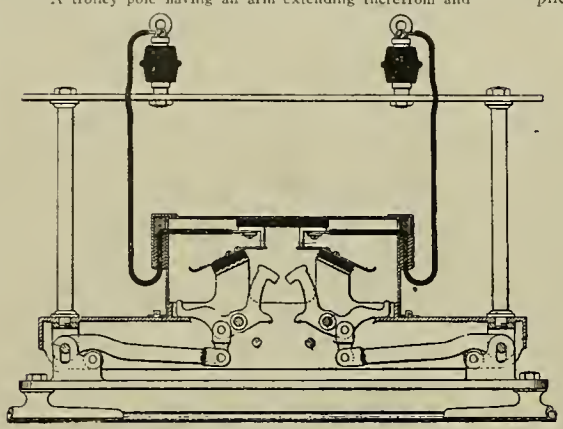
In the wireless transmission of electrical energy by means of electrical impulses transmitted through the earth, an otherwise-insulated capacity area is connected electrically in series through a condenser and a source of electrical impulses to a ground.

776,878. Current-controlling System. William R. Whitehorne, Bethlehem, Pa. Application filed September 22, 1904.

A battery or group of batteries in circuit with a motor, a bank of resistance in series with the battery, a switch for causing the electromotive force of the battery to become either added to or subtracted from that of the current mains, and means for varying the amount of resistance and the amount of battery in circuit are the principal parts. (See cut.)

776,954. Trolley Pole. Charles H. Spangler, Atlanta, Ga. Application filed February 14, 1903.

A trolley pole having an arm extending therefrom and



NO. 776,803.—TROLLEY-OPERATED SWITCH.

a raceway upon the pole in an arc concentric with the arm has means whereby the trolley and its arm are held normally in a plane with the trolley pole.

776,960. Telephone Transmitter. George W. Talley, Atlanta, Ill., assignor of one-half to Robert D. McKown, Atlanta, Ill. Application filed May 19, 1903.

A diaphragm for telephones comprises a sheet of fabric treated with carbon, a mica covering and a protecting surface of shellac or varnish.

776,970. Circuit Changer. James C. Waldo, Sharpsburg, Pa., assignor of one-fourth to John J. Forster, Avalon, Pa. Application filed October 19, 1903.

In the device are a shaft, a contact carried by the shaft, a ratchet wheel mounted on the shaft, reciprocating pawls arranged to engage opposite edges of the ratchet and positive locks operated respectively by the initial movements of the pawls.

776,985. Combinational Telegraph Instrument. Francisco G. Barbosa, Limon, Costa Rica. Application filed December 18, 1903.

The combination consists of a lever mounted upon a journal and free to swing laterally and also to rock in an independent plane, stops disposed below the lever and adapted to be engaged thereby and contact members controllable by lateral movements of the lever, the contact members being closed when the lever is moved laterally in one direction and opened when the lever is moved laterally in another direction.

776,997. Static Electric Machine. Juan G. H. Barboa, Chihuahua, Mexico, assignor of one-third to Christobal M. Ortiz, Chihuahua, Mexico. Application filed August 13, 1903.

A number of cylinders, a flexible belt of insulating material mounted thereon, friction mechanism for engaging the belt, electric connections for the friction mechanism, and collectors for removing electricity from the belt are the features.

776,998. Electric Switch. Thomas A. Cameron, Philadelphia, Pa. Application filed June 14, 1904.

The combination with a lighting circuit consists of a local energy circuit and a public energy circuit, both being normally open, and means included in the lighting circuit and automatically operative to close the public energy circuit. Fusible means to maintain the first mentioned means in a position to close the local energy circuit are provided.

777,014. Apparatus for Transmitting and Receiving Signals. Reginald A. Fessenden, Allegheny, Pa., assignor to the National Electric Signaling Company, Pittsburg, Pa. Original application filed June 2, 1900. Divided and this application filed March 29, 1901.

In a system of signaling by electromagnetic waves are a receiver, means for generating electrical impulses and means for making the receiver unresponsive during the time of generation of electrical impulses.

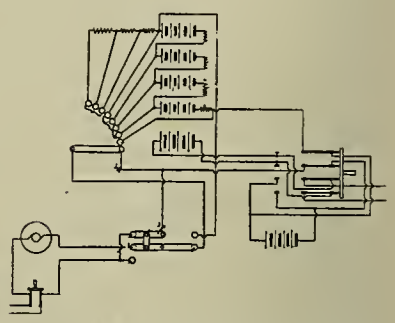
777,027. Convertible Electric Typewriting Machine. George M. Kitzmiller, Norfolk, Va., assignor to the Electric Typewriter Company, Norfolk, Va. Application filed January 23, 1904.

The device comprises a platen, a number of type bars, a series of twisted links and a vertical lever, its upper and lower ends being in vertical planes and bent between its fulcrum point and its upper end. The lever has a projecting arm above its fulcrum point and an extension below its fulcrum point provided with a slot and means for electrically operating the vertical lever. A pivoted key lever having changeable fulcrum points, a number of apertures in the key lever, a vertical arm at right angles to the key lever and slotted at its upper end and pivoted to the key lever in the vicinity of its fulcrum points are other features. The vertical arm is connected to the bent vertical lever and a detachable rod or pin is adapted to fulcrum the key lever and to secure the vertical arm thereon.

777,034. Controlling Device for Electrically Propelled Vehicles. Oskar Lasche, Berlin, Germany, assignor to the General Electric Company, Schenectady, N. Y. Application filed November 4, 1901.

In apparatus for switching electric motors in and out of circuit are means for automatically putting out of circuit one or more individual motors or series of motors on the expenditure of a minimum current, and means for automatically putting into circuit such motor or motors when the motors receiving current become overloaded.

777,039. Electromagnetic Apparatus. Joseph N. Mahoney, Brooklyn, N. Y. Original application filed January 21, 1904. Divided and this application filed March 19, 1904.



NO. 776,878.—CURRENT-CONTROL SYSTEM.

A winding and a shell of magnetic metal inclosing it has a pole piece projecting within the winding and having through it an opening with inclined walls. An armature reciprocable within the winding has its inner end tapered to conform to the taper of the opening in the pole piece, but of such length as to extend through and beyond it.

777,046. Thermostat for Electric Circuits. James P. Robertson, North Sydney, near Sydney, New South Wales, Australia. Original application filed August 13, 1902. Divided and this application filed October 7, 1903.

A device for closing or opening an electrical circuit consists of a flexible normally buckled plate in combination with a thermostat whose action is to effect the buckling of the plate in the opposite direction upon increases of temperature at any place in the area guarded by it.

777,049. Trolley-wheel Guard for Electric Wires. John L. Sullivan, Warren, R. I., assignor of one-half to Josteph Harris, Warren, R. I. Application filed April 19, 1904.

In a trolley-wheel guard for electric wires comprising an arm having one end arranged to be secured to the swinging pole of an electric car and its opposite end terminating in a lateral U-shaped portion is described.

777,052. Trolley Guard. George W. Watson, Kearney, N. J. Application filed February 26, 1904.

A trolley pole having ears and a bolt has a wheel between the ears carried by the bolt and angular plates on the outer sides of the ears. Arms with limiting projections on their inner sides and spriggs for holding the plates in normal position are provided.

EXPIRING PATENTS.

Following is a list of electrical patents (issued by the United States Patent Office) that expired on December 13, 1904:

374,580. Revolving Electric Hammer Tool. W. G. A. Bonwill, Philadelphia, Pa.
374,581. Electric Temperature Indicator. J. C. Boyle, Brooklyn, N. Y.
374,621. Electric Motor or Dynamo Electric Machine. F. Jarvis Patten, Fort Sidney, Neb.
374,631. Galvanic Battery. J. Serson, Boston, Mass.
374,640. Electric Fuse. K. J. Sundstrom, Dover, N. J.
374,652. Circuit-breaker. C. B. Bosworth, Everett, Mass.
374,669. Galvanic Battery. C. R. Freeman, Hartford, Conn.
374,673. Automatic Circuit-closer for Secondary Batteries. W. W. Griscom, Haverford College, Pa.
374,711. Armature. H. B. Slater, Detroit, Mich.
374,728. Dynamo Armature. E. N. Bliss, Newark, N. J.
374,747. Electromedical Apparatus. J. S. Muir, Hanford, Cal.
374,778. Electric Generator and Motor. A. F. Congdon, Philadelphia, Pa.
374,792. Conduit for Electrical Conductors. G. D. Holt, Minneapolis, Minn.
374,842. Safety Strip for Electric Circuits. P. Lange, Pittsburg, Pa., and O. B. Shallenberger, Rochester, N. Y.
374,843. Electric Coupling Device. P. Lange, Pittsburg, Pa.
374,850. Method of Testing Electric Lamp Globes. C. F. Reinmann, Pittsburg, Pa.
374,858. Dynamo Electric Machine. G. Westinghouse, Jr., and H. M. Byllesby, Pittsburg; O. B. Shallenberger, Rochester; Albert Schmid, Allegheny, and E. Hartley, Pittsburg, Pa.
374,860. Apparatus for Measuring Electric Currents. H. Aron, Berlin, Germany.
374,861. Apparatus for Measuring Electric Currents. H. Aron, Berlin, Germany.
374,862. Electric Battery. J. A. Barrett, New York, N. Y.
374,863. Galvanic Battery. J. A. Barrett, New York, N. Y.
374,871. Electric Motor. W. Hochhausen, New York, N. Y.
374,872. Apparatus for Reversing and Controlling Electric Motors and Other Translating Devices. W. Hochhausen, New York, N. Y.
374,883. Electromechanical Movement. H. Van Hoevenbergh, New York, N. Y.
374,907. Multiple Switchboard Test Circuit. C. E. Scribner, Chicago, Ill.
374,910. Regulation of Electric Motors. W. Stanley, Jr., Englewood, N. J.

WESTERN ELECTRICIAN

EVERY SATURDAY

Vol. XXXV. CHICAGO, DECEMBER 24, 1904 No. 26

LIBRARY OF ELECTRICAL ENGINEERING

Some Interesting Features of Aurora-Elgin-Chicago Electric-Railway Operation.

A representative third-rail interurban railway system is that of the Aurora, Elgin and Chicago Railway Company, which has the reputation of operating one of the most up-to-date electric interurban railways in the country. This system was described at length in the Western Electrician of December 1, 1902. Since that time, though no extensive changes have been made in the equipment outside of the addition of a third generator in the power house, the business of the company has increased rapidly and many innovations have been made which add to the comfort of the patrons of the road and make the service now the equal if not the superior of the best steam interurban service between the cities named in the corporate title of the company. The object of the present article is to consider the present work of the company and some recent steps it has taken in the way of furnishing power to farmers, the carrying of milk and newspapers, protection of the third rail from sleet, etc., together with a brief outline of the equipment of the system.

The Aurora, Elgin and Chicago third-rail line extends from Fifty-second Avenue, Chicago, west to Wheaton, Ill., a distance of 19 miles; this portion is double-tracked throughout. From Wheaton a single track extends in a southwesterly direction to Aurora, 14 miles. From Eola Junction, on the Wheaton-Aurora branch, a short line extends northwest to Batavia, at which point is located the one great power house of the system, which was erected and equipped at a total cost of nearly $1,000,000. Another limb of the line, also single track, extends northwest from Wheaton to Elgin, 16½ miles. The single-track portions of the road are provided with frequent sidings, and this, together with a strict operating schedule, gives uninterrupted service.

The tracks are built over private right-of-way, for the most part 60 to 100 feet wide. Cuts on the single-track portions are excavated to a width sufficient to allow of a double track when the time arrives for its construction. Eighty-pound rails with the A. S. C. E. section are used and the roadbed is constructed on the lines of the best steam-railway practice. The aim has been to limit all grades to one per cent. Fig. 3 is a view of a portion of the double-track construction.

The Chicago terminal is a transfer station for connections with the Garfield branch of the Metropolitan West Side (elevated) railway. Two-car trains leave Fifty-second Avenue every half hour for Wheaton, when they divide, one car going to Aurora, the other to Elgin. On the return trip the cars meet again at Wheaton and the two are run in together to Chicago. To give an idea of the speed which is maintained on this road it may be interesting to note that a car recently made the trip from Aurora to the Fifty-second Avenue station, a distance of 33 miles, in 34 minutes. This included seven stops. Cars have been frequently run for short distances at a speed of over 70 miles an hour. The traffic is handled by telephone train-dispatching system, the head train dispatcher being located at Wheaton.

The power house, located at Batavia, is shown in Fig. 1, and was one of the first high-tension alternating-current generating plants to go into operation in which all the switching is done on the high-voltage side of step-upand step-down transformers. Current for operating the line is generated by three 1,500-kilowatt General Electric three-phase generators, having each a 20-foot 80-ton flywheel. These generators are driven by three cross-compound condensing Corliss engines, manufactured by the C. and G. Cooper Company, which run at 75 revolutions a minute. Space has also been left for a fourth similar unit.

The boilers are of the water-tube type of 500 horsepower each and carry a pressure of 180 pounds. The chimney, as shown in Fig. 1, is of brick and stone, 240 feet high, with a flue 11 feet in diameter.

Each generator has its own bank of three transformers, as does also each rotary converter in the sub-stations. The transformers are considered as a unit with the generators and the converters, and in the case of the generators there is no intermediate switch or circuit-breaker.

Current from the main generators after passing through the step-up transformers is raised to 26,000 volts, the leads being then taken through motor-operated oil switches, after which they are led to the high-tension bus bars in a separate compartment of the power house. Besides furnishing power to its own system this station also furnishes the power for the Elgin, Aurora and Southern trolley line.

The system is laid out with six sub-stations, the transmission pressure being 26,000 volts, three phase. The high-tension lines are carried upon cross-arms 24 inches apart, with the insulators on the lower cross-arm 30 inches between centers. Telephone lines for the dispatching service are carried on cross-arms seven feet below the transmission lines. Fig. 3 shows the transmission lines and telephone circuits on the right.

No direct-current feeders are needed, as the third rail is constructed of a special alloy having a high conductivity, and is moreover of large cross-section (1,500,000 circular mils on the main line), giving it ample capacity to conduct the current from the sub-stations to any intermediate point on the line.

Regular sub-station equipment in all the sub-stations consists of two 1,500-kilowatt rotary converters, each with a bank of three transformers. The stations have air-tight bus-bar compartments, which are kept cool by air under pressure delivered by a blower. The machines may be started with alternating current from the transmission line or by direct current from the third rail. When starting, as synchronous motors on the high-tension side, reactive coils are used to counteract the influence of the leading current produced, thus keeping the power factor as near unity as possible.

The cars are of the general type shown in Fig. 2, which offers also a good example of the bridgework along the line. They are 47½ feet long and 39 feet four inches over bodies and seat 56 people. The cars are up-to-date in all particulars, possessing electric heaters, transverse cane seats, toilet rooms, smoking compartment, etc. Four new cars of the same type have lately been added which are several feet longer. These cars, with one express car, one convertible buffet and parlor car, the latter described in the Western Electrician of September 10th, complete the rolling-stock equipment.

Having thus briefly outlined the general equipment of the system, it will be interesting to note some of the new ideas which have been developed by the company. One of these is the method of fighting snow and sleet which was tried last winter with success and which equipment is now a part of every car.

In years past a great deal of annoyance and delay were encountered in fighting sleet which collected upon the third rail, interrupting the traffic. Many plans were devised to do away with the trouble, including various kinds of cutters, etc., all of which proved unsatisfactory. Finally a method was tried which has been successful and which consists in sprinkling the third rail with a solution of calcium chloride ($CaCl_2$). The solution used consists of the $CaCl_2$ mixed with water until the specific gravity is about 1.2. The freezing point of the mixture thus obtained is 30° below zero. The solution is prepared

Fig. 2. Three-car Train Crossing Bridge. Fig. 1. Power House at Batavia, Ill. Fig. 3. View of Double-track Construction.

SOME INTERESTING FEATURES OF AURORA-ELGIN-CHICAGO ELECTRIC-RAILWAY OPERATION.

in large quantities in a 45-barrel tank at Wheaton, from which it is readily delivered to the cars. Upon each car is carried a small galvanized iron tank holding sufficient of the liquid to last the car on a 20 or 30-mile run. A rubber tube passes down through the platform to a brush-like arrangement shown in Fig. 4. The brush is of steel and is pressed upon the rail by a spring. It may, however, be sustained in a raised position by a catch which holds it after it has been raised by the rubber insulating handle shown in the picture. A bent section of gaspipe attached to the lower end of the rubber tube delivers the solution to the rail just ahead of the brush.

The action of the solution upon the ice is a peculiar one, seeming to decay the ice and make it

FIG. 4. APPARATUS ON AURORA-ELGIN-CHICAGO CARS FOR REMOVING ICE FROM THIRD-RAIL.

porous and scaly so that it is readily swept away by the brush, or at least a sufficient amount of it so that the shoe which follows behind is given sufficient contact to deliver the necessary current.

Not only does the solution destroy the ice but it also protects the rail for a limited length of time from the further collection of sleet. The solution is not expensive and the cost is insignificant when compared with the great amount of time and expense saved by its use.

An interesting experiment which the company is making is the furnishing to farmers living near the line with electric power direct from the third rail. The results have been highly satisfactory so far to the farmers who have had the power brought to their farms. Of course the quantities of power sold by the railway company are small and intermittent and there is not a large amount of profit derived from the power thus sold. But it is a far-sighted policy, nevertheless, as anything which contributes to the prosperity of those living in the neighborhood of the line will in the end benefit the railway company.

Thus far there are 40 to 50 farms connected in this way to the system. The power can be used for a variety of purposes, such as threshing, grinding, sawing wood, etc. It is the common practice of the farmers in this part of the state to do their threshing and grinding on the barn floor, so in installing the motor equipment a line shaft is generally employed in the barn belted to the motor and driving in turn by pulleys the various machines.

Fifteen horsepower is the popular size of motor, though some of 20 horsepower have been installed. They are connected by a metallic circuit to the source, one wire being connected to the third rail and the other to the track rail.

The average cost is from $500 to $675 for each installation. This is not far from one-half the cost of a gasoline engine of the same power. No difficulty is experienced in the operation of the motors, which is a much more simple task than the running of a complicated gas engine. Directions accompany each motor and all that the farmer has to master besides the throwing of the switches is the replacement of blown fuses and the care of the commutator and brushes.

So even is the voltage on the third-rail due to its large cross-section and to the ample power supplied that a number of farmers have tried lighting as well as power work. For this purpose six lamps are connected in series and the pressure on the third rail being in the neighborhood of 600 volts, the lights are run somewhat below normal voltage, therefore giving them long life, though they are not quite up to full candlepower.

This is one of the first attempts made by an interurban road to furnish power to adjacent farms and is creating considerable attention. The farmers who are now connected would not change back to the old method, and to all appearances the electric motor has come to stay.

Superintendent Wendell Ballou of the Elgin, Aurora and Southern Traction Company has been prominently connected with the movement, having had the installation of the motors under his personal supervision.

Not only is the farmer benefited by the installation of electrical machinery upon his farm but he is also afforded a ready means for transporting milk to Chicago, which furnishes the best market for this product. Hand in hand with this goes the delivery of early morning newspapers to the various towns along the road. This dual service is performed by one express car, which is enabled to make one paying trip each way per day. The newspaper service was begun in 1903, and it is estimated that as high as 80 or 90 tons of newspapers were carried each month during the summer just past.

As soon as the first installment of the last edition of the morning papers is off the press, which is about 3:30 a. m., they are hurried to the Fifth Avenue terminal station of the Metropolitan Elevated railway, over whose tracks the express car is allowed to pass. Here the car is waiting for them, and by means of a sort of endless-chain lift provided with extending arms to carry up the bundles of newspapers they are lifted up and dumped into the car on the tracks above.

About 25 per cent. of the papers are delivered at Fifty-second Avenue, Chicago, for distribution to Oak Park and nearby suburbs. Twenty per cent. go to Aurora, as many more to Elgin and the remainder are delivered to the Elgin, Aurora and Southern Traction Company for delivery to more distant points. By this means the latest editions of the morning papers can be delivered to the points named from 45 minutes to one hour and 30 minutes earlier than could be done by the steam roads, giving the people the latest edition instead of the "country" edition. The company receives its pay from the publishers on a tonnage basis.

Arriving at Wheaton about six o'clock in the morning the "newspaper special" is ready to begin collecting milk. It is first run to Eola Junction and picks up the milk cans from there in toward Chicago, arriving at Fifty-second Avenue at about 8:40 a. m., where the milk is delivered to the city milk dealers. Fifteen cents per eight-gallon can is charged, which is prepaid by a milk ticket inserted in the holder on each can. The average amount of milk carried each day is about 1,400 gallons.

As an example of another unique departure made by this company may be mentioned the buffet car, which, as stated above, has been already described in the Western Electrician. This car is the first of its kind ever operated upon an electric railway and is a model of convenience. It is intended to permit men living in the cities of Aurora, Wheaton and Elgin or other towns along the line whose places of business are in Chicago to take their morning or evening meals on the way if they so desire. So well is this car balanced that a glass of water filled to within a quarter of an inch of the brim will ride upon one of the tables without the water being spilled when the car is traveling 60 miles an hour and over, which can hardly be said of a dining car upon a steam road even when traveling over a first-class roadbed.

An agreement has recently been reached between the Aurora, Elgin and Chicago Railway Company and the Illinois Central railroad which is not only of much importance to the two interests concerned but which may be looked upon as significant of the general trend toward more amicable relations between steam and electric railways. A freight-traffic arrangement has been entered into by the two companies whereby through freight on the Illinois Central may now be billed to Elgin, Wheaton and Wayne, completing part of its journey over the electric line. The electric company receives a portion of the tariff, giving at the same time the Illinois Central entrance, practically, as far as freight is concerned, to the above-named towns.

The president of the Aurora, Elgin and Chicago Railway Company is Mr. L. J. Wolf of Cleveland. Mr. E. C. Faber is general manager of the company and Mr. Edward F. Gould is the electrical engineer. Both gentlemen make their headquarters at Wheaton, Ill.

Automatic Control for Railway Motors.

Heavy-traffic electric railways necessitate the employment of motor carriages carrying more than one motor, so that they may quickly attain a predetermined rate of speed. In starting these motors have a great strain to overcome, while when traveling at normal speed or downhill the amount of current consumed by the motors becomes less. In order to secure the highest possible useful effect and to save the power wasted by the several motors in running idle fewer motors are conveniently brought into operation for the purpose of generating the diminished amount of power which is required. To this end it should be feasible to switch the desired number of motors out of circuit whenever the actual expenditure of current has decreased, and, conversely, in ascending gradients it will be necessary to switch the whole or part of those motors into circuit again to avoid overloading the limited number of motors which are in operation already. In addition to this all the motors have to be protected from overloading, and this is generally effected by the employment of a maximum cut-out adapted electrically to disconnect all the motors at the same time and to be operated by hand only.

Now the object of the invention illustrated herewith is to enable all or any of the motors to be cut out whenever required by means of automatic mechanism operating independently of any interference on the part of the driver, and thereby to provide for the economical consumption of current.

With this object in view Oskar Lasche of Berlin, Germany, has patented a system which he has

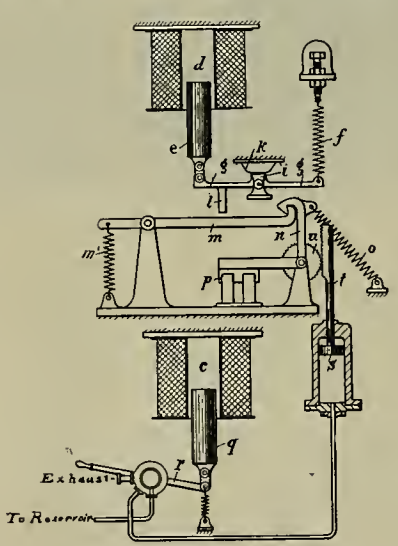


Fig. 1. Construction of Coil.

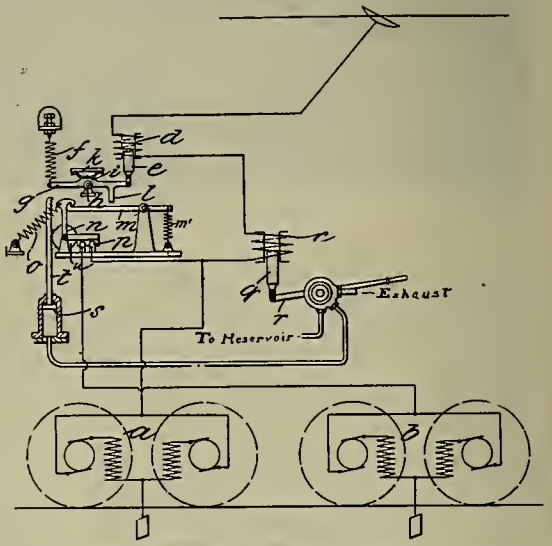

Fig. 2. Connection of Apparatus to Motors.

AUTOMATIC CONTROL FOR RAILWAY MOTORS.

assigned to the General Electric Company and which is the one shown by the diagrams.

As illustrated in Figs. 1 and 2, there are assumed to be two series of motors (a) and (b), each series being supposed, by way of illustration, to comprise two motors connected in parallel in a three-wire circuit common to both. The maximum cut-out (c) is in the main circuit in series with the minimum cut-out (d).

The operation is as follows: The construction of the coil (d), Fig. 1, is such that while current is being expended by the motors (b) at the normal rate the iron core (e) maintains the spring (f) in a state of equilibrium. The double-armed lever (g), pivoted by one arm, supports the iron core (e) and by the other the spring (f), both being adjustable according to predetermined amperages. Rigidly connected with the double-armed lever (g) is a projecting piece (i) supporting a level surface. This surface is adapted to rest against the spring (k), and thus to deaden the vibrations which occur when the iron core (e) is attracted as a result of the impulses of current. Besides, this plane surface and the spring (f) afford the means of providing for differences of current arising in consequence of the switching out and switching in of the other series of motors (h), Fig. 2. When the expenditure of current has reached a given minimum, but not before, the tension of the spring (f) overcomes the attractive force of the coil (d) and the friction between the surface (i) and the spring (k), so that the projection (l) will depress the horizontal lever (m) against the action of the spring (m') and release the bell-crank lever (n). The spring (o), which is thus strained, now comes into operation. It breaks the circuit at the contact point (p), and consequently cuts out of the circuit the second series of motors (b), so that now all the work to be performed devolves upon the first series (a). As regards the coil (c), it lies in the circuit of the series of motors (a) and is so constructed that the iron core (q) becomes attracted the moment the load of the motors attains a given maximum. By the movement of the iron core (q) a lever (r) is set in motion, and this lever, through the intermediate agency of compressed air or water under pressure and by means of the piston (s), rack (t) and toothed wheel (u) closes the circuit once more at the contact point (p). The series of motors (b) is now again supplied with current, so that all the motors available once more perform their share of the work. The same result might be attained by the aid of compressed air, water under pressure, an auxiliary motor or the like. The moment contact has been made at (p) the series of motors (b) again receive current and the coil (d) draws the lever (g) back to its original horizontal position.

The Houston, Licking and Salem Electric Railway Company of Houston, Mo., has been organized to build an electric railway connecting the three towns. The directors are James A. Craven, Robert Lamar and others.

International Jurors in the Electricity Section at the World's Fair.

The accompanying group of portraits shows 38 of the domestic and foreign jurors in the Electricity Section of the International Jury of Awards of the Universal Exposition of 1904 at St. Louis. Many well-known electrical educators and engineers served on the jury. The group picture does not show all the electrical jurors, several not being present at the time the photograph was made. It is, however, the most complete picture of the electrical jury extant. Following is a complete list of the names of the jurors of the Electrical Section, with the assignment to groups and the chairmen, vice-chairmen and secretaries of each group indicated. The numbers refer to corresponding numbers on the portraits in the group. Where no number is given it means that that juror was not present when the group photograph was taken:

GROUP 67.—MACHINES FOR GENERATING AND USING ELECTRICITY.

W. V. N. Powelson, chairman.
6. G. Holschuch, vice-chairman.
26. Prof. H. H. Norris, secretary.
5. E. Solari.
34. C. W. Wason.
P. O. Keilholtz.
H. Floy.
31. E. P. Roberts.
F. G. Baum.
36. Prof. J. P. Jackson.
32. O. T. Crosby.
37. Prof. G. F. Sever.
11. H. Shibusawa.
H. H. Gerry.
Prof. R. B. Owens.
J. W. Esterline.

GROUP 68.—ELECTROCHEMISTRY.

21 Carl Hering, chairman.
25. Chas. F. Burgess, sec.
38. Samuel Sheldon.
12. K. Sosnowski.

GROUP 69.—ELECTRIC LIGHTING.

Harold B. Smith, chairman.
7. Guido Grassi, vice-chairman.
18. B. V. Swenson, secretary.
23. George D. Shepardson.
24. Warren E. Weinsheimer.
C. A. Adams.
10. Alfred Dennery.
22. F. P. Anderson.
33. E. L. Nichols.
8. Prof. W. E. Goldsborough, chief, Department of Electricity.
9. Dr. Kable.

GROUP 70.—TELEGRAPHY AND TELEPHONY.

20. William J. Hammer. chairman.
4. Gaston Roux, vice-chairman.
16. Prof. A. S. Langsdorf, secretary.
3. A. I. da Costa Couto.
17. Dr. F. B. Herzog.

INTERNATIONAL JURORS IN THE ELECTRICITY SECTION AT ST. LOUIS EXPOSITION.

Electrical Section of the Western Society of Engineers.

A meeting of the electrical section of the Western Society of Engineers was held in the society's rooms in the Monadnock Building on the evening of December 16th. Professor Crew of Northwestern University read a paper, referred to elsewhere in this issue. According to the rules of the Electrical Section, the officers of the section are to be nominated at the December meeting. The names are then posted for one month and voted upon at the January meeting. In accordance with this provision nominations were made as follows: Chairman, W. B. Hale; vice-chairman, S. G. McMeen; executive committee, W. G. Carlton, George A. Damon and P. B. Woodworth. The election, which will take place at the January meeting, will be the first in the history of the Electrical Section of the Western Society of Engineers.

January 13th is the date of the next meeting, at which a paper by Mr. C. A. S. Howlett upon the "Commercial Aspect of Engineering" will be presented.

Long Overland Wireless Communication.

A telegram from Lee De Forest dated at Kansas City, Mo., on December 15th is authority for the statement that the De Forest Wireless Telegraph Company is now sending messages by space telegraphy from Kansas City to Chicago and Cleveland direct, without relay, breaking all records for overland wireless. It is said that the Kansas City station will be opened on the first of January for commercial business with St. Louis, Springfield, Chicago, Cleveland and Buffalo.

At the Chicago office of the De Forest company it was learned from William H. Ocker, manager, that on the date above mentioned several wireless messages were received at the Chicago station from Kansas City, among them being the following: "John Farson, Farson, Leach & Co., Chicago. Am pleased to be able to send you an aerogram from Kansas City, 450 miles. This is the record up to date. We will begin commercial business from Kansas City to St. Louis and Springfield in a few days and are accepting all the business we can handle. Lee De Forest."

It was asserted later at the Chicago office that a message had been sent to Cleveland from Kansas City, a distance of 725 miles. The Chicago station of the De Forest company at present can only receive messages. The sending apparatus is now being installed and will be in operation within two weeks, it is said.

Chicago Street-railway Situation.

As to the next move in the Chicago traction situation, much depends on what Judge Grosscup may decide in the case, which is on hearing before him at this writing. He has been asked to issue an indefinite amount of receivers' certificates, which is being strongly opposed by the underlying companies of the Union Traction Company. If the judge refuses the application, it is said, the new enterprise in which Marshall Field, John J. Mitchell, J. P. Morgan, Thomas Ryan and others are interested, will be launched. Arrangements are said to have been completed by these financiers where by the Chicago City system and the properties of the North and West Side companies are to be bought and developed into one comprehensive system. The Chicago Union Traction Company is to be ignored, according to the plan.

The Chicago City Council at its meeting this week extended the agreement under which the Chicago City company is operating until February, 28, 1905. The pending ordinance for this company was made a special order for the council meeting of January 23, 1905.

Electrical Method of Thawing Water Pipes.[1]

By George S. Haley.

Aside from the remarkably clean and effective manner in which the electric outfit does its work, no other method being, in my estimation, near enough for comparison, the value to insurance companies must be worth considering. From a reliable source I find that during the year of 1898 insurance companies paid about $300,000 in losses caused by fires started by other methods of thawing water pipes. Everyone is familiar with the usual methods of thawing pipes practiced by plumbers, and when

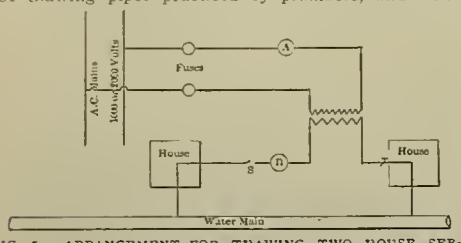

FIG. 1. ARRANGEMENT FOR THAWING TWO HOUSE SERVICES AT ONCE.

digging has to be resorted to it is a very expensive proposition, and even plumbers are justified in rendering the enormous bills credited them.

As to the method of procedure to thaw with electric current, assuming an alternating current of 1,000 or 2,000 volts is available, the necessary requisites are as follows:

1. A transformer of 10 to 15-kilowatt capacity, with 50 and 100-volt secondary; for ordinary house services, 50 volts is sufficient.
2. An ammeter reading to 30 amperes, if placed in the primary.
3. Primary cut-outs.
4. Single-pole switch in secondary.
5. A resistance that can be made as described in Fig. 5.

Connect up the instrument as shown in Fig. 1, leaving the movable electrode out of the water. Close the primary switch and drop the lower end of the electrode into the water, watching the ammeter, which should indicate three to five amperes and which will increase as the electrode is given more contact with the water; the maximum amount of

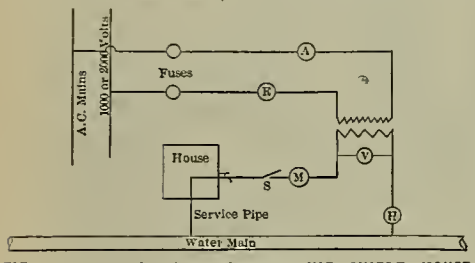

FIG. 2. ARRANGEMENT FOR THAWING SINGLE HOUSE SERVICE.

current will depend on the resistance of the pipe. By consulting the table the amounts of current required for different services, mains, etc., also the length of application, may be approximated.

The most practical arrangement, aside from a transformer made for the purpose, is shown in Fig. 2. A choke coil, made as described in connection with Fig. 4 and placed between the primary switch and the transformer, gives practically the same results and is much more efficient and easily handled.

Before closing the secondary switch, the position of the core of the choke coil should be noted. It should be completely inside the choke coil, and to increase the secondary current, withdraw it until the required amperes are obtained.

Fig. 1 shows two house services being thawed at the same time, one end of each secondary being attached to the sillcock of each house, the resistance

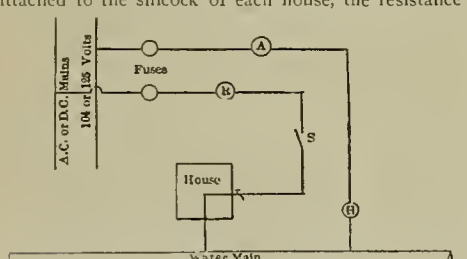

FIG. 3. CONNECTION FOR USE WITH 104 TO 125-VOLT CIRCUIT.

(R) being placed in the secondary circuit. Ammeter (A) indicates the number of amperes in the primary circuit. The transformer should be protected by suitable fuses, located either upon the pole adjacent to the primary feeders or upon the wagon.

Fig. 2 shows one house service being thawed and connected to one side of the secondary feeder, the other being connected to hydrant (H). In the diagram, (A) represents the ammeter in the primary circuit, (M) a recording wattmeter in the secondary, and (V) a voltmeter connected across the secondary terminals of the transformer.

Fig. 3 shows a connection for the use of 104 to 125 volts, alternating or direct current. This arrangement is applicable to isolated plants using two or three-wire low-voltage distribution. (A) indicates the ammeter and (R) the resistance.

Fig. 4 shows a choke coil suitable to control for all purposes a 15 or 20-kilowatt transformer with 2,000 volts primary, and is constructed as follows:

A tube 16 inches long, two inches in diameter, is made by winding a sheet of one-sixteenth-inch red fiber around an iron mandrel four times and held in place by a few small tacks. Two wooden beads are provided, six inches in diameter by three-quarters of an inch thick, and secured to the ends of the fiber tube. A winding, consisting of 200 turns of No. 12 weatherproof wire, is placed on the spool after it has been given several coats of shellac and dried. A core is made of No. 14 iron wire in pieces 16 inches long, held together by a few turns of fine iron wire and covered by two layers of tape. The center wires are cut four inches longer, and over them is placed a wooden handle.

Fig. 5 illustrates the simplest form of rheostat suitable for either primary or secondary, but recommended for secondary sides only, because of safety to those using it. It is a barrel of water to which 10 pounds of common salt has been added, with two electrodes, each made of a coil of 10 feet of No. 2 bare copper wire in a flat spiral, or a six-inch pipe flange, one fastened to the side of the barrel near the bottom, the other so arranged that it can be raised or lowered. The cut shows such an arrangement, which may, of course, be elaborated upon according to the ideas of the user. This form of resistance has been used by the majority of those who have thawed pipes by electric current, probably because it was the easiest obtained; while not strictly up-to-date, electrically speaking, it certainly answers the purpose. A rheostat of this description will handle 300 amperes for a short time; if continued, the water will probably boil over.

Fig. 6 shows a connection used by one correspondent using an ordinary transformer, wound for 1,000 and 2,000 volts primary, and used upon a 1,000-volt circuit; the secondary voltage is 50. (A) and (4) on the diagram indicate the fuse plugs in the primary circuit; (1) (2) (3) indicate plug cut-outs, having but one plug for all three; (B) is a plug used to short-circuit the choke coil. While manipulating plugs (1) (2) (3) and the choke coil the correspondent states that any voltage between 17.5 and 50 is obtainable. It would seem that sufficient variation should be obtained either by the use of the choke coil or by the changing of the connections in the transformer.

Fig. 7 indicates connections of standard transformers giving the voltage from 22 volts to 220. A five-kilowatt transformer is connected to the 2,200-volt primary; the secondary is 220 volts, and feeds the primaries of two 15-kilowatt transformers. The ratio is one to five, their secondaries being connected in multiple.

Fig. 8 is a picture of an outfit used in Durango, Colo., which is the most complete in detail of any that have come to our notice. Four small transformers, taken from the scrap pile, with 55-volt secondaries, were placed in the wagon in front of the switchboard. In the secondary of each transformer is placed a choke coil, described as follows:

The choke coils are about 18 inches long, with a core 2.5 inches in diameter, formed on a brass tube with cast ends, a slot being cut lengthwise through the tube and ends to prevent the formation of a closed secondary circuit in the spool. After being thoroughly insulated, each core is wound with two layers of No. 4 magnet wire. The cores, which are 18 inches long, consist of 500 pieces of No. 14 annealed iron wire, which are assembled around a central iron rod, threaded at each end, with two fiber heads turned to fit the tube. The whole core is covered with several layers of cotton tape coated with insulating varnish. Above each choke coil is placed a 75-ampere double-pole knife switch and a 100-ampere double-pole D. & W. cut-out; also one 350-ampere ammeter and one 150-volt voltmeter. There are also four pilot lamps, one of each being connected to the four transformers, which, by the switches mentioned, can be thrown in multiple. On the back of the wagon cover are placed two General Electric primary cut-outs, and just back of these, not shown, is a 30-ampere, double-pole, quick-break knife switch, placed in the primary circuit. The secondary leads are composed of No. 00 cable wire with connectors made of brass, to facilitate the connections of the pipe system. To use this outfit the primaries are brought from the pole to the cut-outs. The secondary connections are made to two houses, or one house and a hydrant. The primaries and secondaries are then closed and the cores pulled

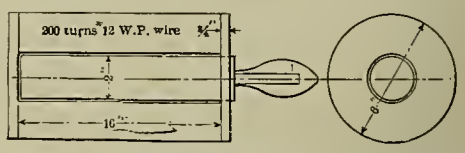

FIG. 4. CHOKE COIL SUITABLE FOR 15 OR 20-KILOWATT TRANSFORMERS.

out of the choke coil until the desired amount of current is obtained.

A transformer is also made by the Pittsburg Transformer Company for the purpose of thawing pipes. [This transformer was described in the Western Electrician of December 3d.]

ABSTRACTS FROM LETTERS RECEIVED GIVING PERSONAL IDEAS OF CORRESPONDENTS AND OTHER INFORMATION.

From replies received from the various plants throughout the United States and Canada, we learn that at least 75 electric-light and power companies have employed this method of thawing frozen pipes.

A correspondent states that "where the services were frozen between the street main and the curb, the work was paid for by the waterworks; when frozen between the curb line and the customer's outlet, it was paid for by the consumer."

A correspondent writes: "Owing to the discontent among the plumbers when we quoted figures to customers direct, we finally adopted a plan to do the work for plumbers only, thereby relieving ourselves of the trouble caused by bursted water pipes, etc. The plumber takes care of this work himself and is required to be on the ground to superintend that portion of it." A fixed charge was made of $15 per service connection. The amount received by the plumber was not given.

A correspondent states that in his opinion it would be better for the city to own the electrical apparatus, and when not employed for its own use it could rent it to the plumbing establishment or to private parties. His company would be quite willing to detail a man to make connections to these lines, and make a record of current, making a suitable charge for the time of the man and current.

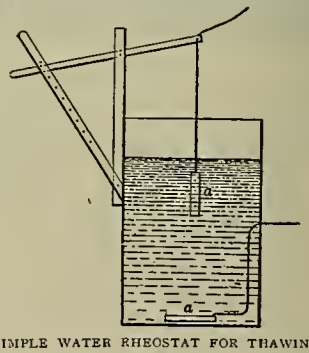

FIG. 5. SIMPLE WATER RHEOSTAT FOR THAWING WATER PIPES.

In other plans, as it has found, the company is liable to get into conflict with plumbing establishments and central labor unions.

The price charged for this work is, in almost every case, a lump sum, which varies from $2.50 to $25 per service. As a rule, the smaller towns charge from $2.50 to $5, generally the latter amount. In the larger cities, the prices run from $10 to $25, averaging about $15 per service. A few correspondents refused to mention the price they charged for the work, but stated that they made it large enough to cover the cost price and make a fair profit.

A correspondent states that the company charges a certain amount for the first service thawed for one day at one setting, and if there are more to be thawed on the same day, only two-thirds of the price is charged for additional services. The charges are based on what it would cost the waterworks department to thaw an ordinary service by the old method, rather than what it actually costs the electric company; the cost to the electric company is very small.

A correspondent states that the average rate was $3; the minimum charge was $2 per service and one

1. Condensation of a report prepared for the National Electric Light Association. Mr. Haley is superintendent of the Rutland City Electric Company of Rutland, Vt.

hour's time for two men, use of apparatus and current, which included the time of moving from one job to another. If more time was consumed, it was at the rate of $1.50 per hour.

A correspondent states that the company charged a lump sum of $15 per house service, out of which it gave the licensed plumber 20 per cent. for collecting and assuming all responsibilities, as to damage to pipes, etc.

A correspondent states that $25 per day was charged for the outfit, including the use of the team,

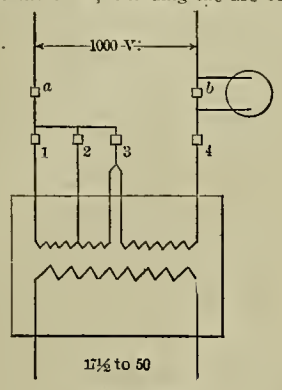

FIG. 6. CONNECTION USING ORDINARY 1000 AND 2000 VOLT TRANSFORMER.

wagon, driver and four linemen; also transformers, wire and other necessary apparatus; the current consumed was also included. The city supplied a policeman and a man detailed from the waterworks.

A correspondent states: "We expect to derive considerable revenue from this source, and will probably advertise a little. The outfit necessary for the operation consists of a horse and wagon, one experienced operator and one lineman. The force should be able to complete work inside of two hours after arriving at the point of trouble. The cost of melting pipe, when done by the plumbers, varies from $10 to $50, depending upon how much bad luck they have had in working upon the wrong part of the pipe, and the time the customer is off from his service in some cases amounts to a week. Under these conditions, we feel that the public will look favorably upon a charge of $10 for quick service."

In regard to measuring the current, but very few correspondents seem to have taken the trouble to make accurate measurements of the current. Usually an ammeter was placed in the primary, in order that the transformers might not be overloaded to such an extent as to cause them to be damaged. A few used both an ammeter and a voltmeter, from which readings were kept and current figured on a volt-ampere basis.

A correspondent used 15-ampere fuses in the primary, and as they were not blown he was satisfied that he did not use much over the amount mentioned. A correspondent states that the only way they could tell how much current they were using

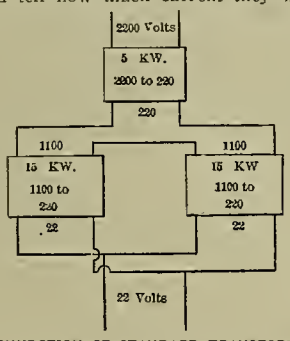

FIG. 7. CONNECTION OF STANDARD TRANSFORMERS WITH VOLTAGE OF 22 TO 220.

was by the way the water boiled in the barrel used for the rheostat.

A correspondent states as follows in reference to the measurement of current: "We find that the water always begins to flow before the lead pipe shows any appreciable heating. We intend, therefore, to dispense entirely with ammeters and instead to make use of the temperature of a piece of lead pipe filled with water, which will be inserted in the low-voltage circuit at the switch. Should the amperes in any particular case be twice as much as is needed—say, 400 amperes instead of 200 amperes—I believe the only effect will be to shorten the time needed for melting the ice and starting the flow of water. The frozen pipe surrounded by earth at a temperature less than 32 degrees Fahrenheit can be regarded as a reservoir for heat, in which a certain quantity of heat must be generated and stored before melting takes place. If this heat is stored in half the time, the same temperature approximately will be attained in each case, and it therefore makes no difference whether or not the current is increased abnormally, provided the time is correspondingly shortened. The only danger in passing an abnormally large current through the water pipe is when the excessive current is kept on until the pipe reaches a steady temperature, and the lead-pipe temperature indicator mentioned above will be an absolute measure of this."

All voltages from 2.5 to 500 seem to have been used. Only a few answers indicate that elaborate tests have been made. The majority of the work has been done, apparently, with little regard to the current consumption, the price charged being high enough to make up for any deficiency in this respect. From one correspondent we have the following:

"A length of 40 feet of one-half-inch lead pipe required 186 amperes at 12 volts applied for five minutes.

"For a length of 20 feet of half-inch extra-heavy lead pipe, 10 volts was required to force 150 amperes through, and from 12 to 15 volts for 200 amperes. With a current of 200 amperes, the water was started in three minutes, but it was found necessary to raise the current to 281 amperes with a voltage of 18 applied for 15 minutes. By this time the pipe was quite warm, the temperature being about 115 degrees Fahrenheit, which proved that there was no longer any ice in the pipe and that the flow of water was obstructed by other causes.

FIG. 8. OUTFIT USED IN DURANGO, COLO. FOR THAWING FROZEN WATER PIPES.

One hundred feet of half-inch lead pipe required a pressure of 37 volts to force 270 amperes through; time required, five minutes. In this case the current passed through 100 feet of water main. The actual kilowatts in this case were 7.5, which, for the space of five minutes, represents 0.62 kilowatt-hour. Another case of 60 feet of half-inch lead pipe in circuit with 60 feet of water main required 200 amperes at a voltage of 10 for 20 minutes to free the pipe. The current consumption in this case was about 0.70 kilowatt-hour. One hundred feet of small service pipe, supposed to be of iron, required 200 amperes at 25 volts for five minutes, the current consumption being about 0.33 kilowatt-hour.

The alternating current seems to be used almost universally for this work, and in only one or two instances has the direct current been used. A correspondent states that in the use of direct current, he found that the energy would all be expended at or near the positive connection of the pipe, he having noticed that the ice had melted and the water boiled in the pipe at the positive connection, while at the negative connection, three feet away, there was no indication of heat whatever. He stated further that the alternating current was much more effective than the direct current, and that he could accomplish more with less than one-half the amperes of alternating current. In one instance he applied from 400 to 480 amperes at 104 volts direct current to a two-inch water main for six hours the first day and eight hours the next, making no impression whatever. After four or five days of very cold weather, he applied 150 amperes of the alternating current, and thawed it out in about three hours.

Transformers of all descriptions were used. In many cases they were taken from scrap piles, and put to good use thawing pipes. The secondary voltage seems about equally divided between 50 and 100 volts; evidently because standard transformers were used, and 50 volts in some instances not found enough, 100 was used, as it covered all cases, regardless, however, of current consumption. In thawing lengths from 100 to 200 feet of service pipes or of mains, the opinion seems to be that from 75 to 100 volts are necessary at times. The average capacity of transformers used is about 15 kilowatts.

A correspondent states that he would advise the purchase of a special transformer for this purpose, with a secondary voltage of 50-75 and 100. This arrangement of voltage, in connection with the water rheostat, he thought, would take care of any case they might encounter. The capacity should be about 20 kilowatts with an overload margin of 50 per cent. for one-half hour. He could afford to pay about $250 for such an outfit, and thought it advisable to induce the city to purchase or carry an investment of such a transformer to be used for this work, and for it exclusively.

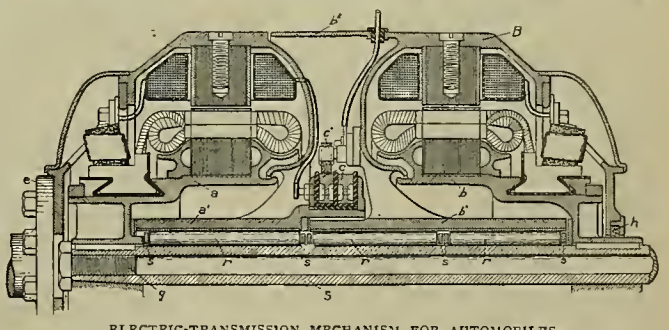
Electric-transmission Mechanism for Automobiles.

A patent has been recently assigned to the General Electric Company by the inventor, Charles G. Simonds of Schenectady, N. Y., which is directly applicable to the driving of electric automobiles and relates to the electric transmission which in this class of vehicle must of necessity be compact, self-contained and practically dustproof.

It has been proposed heretofore to transmit the power from a prime mover to the load with variable relations of speed and torque by means of an electric generator having both parts movable, one driven by the prime mover and the other connected to the load, the generator being driven by a gas engine carried by the automobile. The relative slip of the two members of the generator can be adjusted by varying the field strength of the generator, and in this manner the load speed may be regulated. Moreover, the energy generated by the relative movement of the two members of the generator may be utilized in a motor arranged to convert this energy into mechanical power and to apply it in driving the load. Such a transmission mechanism involves certain mechanical difficulties, since both members of the generator must be made rotatable. In the case of an automobile drive, where the mechanism is subject to hard usage, where the available space is limited, and where all parts are continually attacked by dust, the difficulties of mechanical construction are increased.

The object of Mr. Simond's invention is to provide a strong, compact, self-contained and practically dustproof construction for such a transmission mechanism as has been described above.

Referring to the accompanying illustration, it will be seen that the field (A), which is bolted to the engine flange, is extended on its inner side by a web, so as nearly to encircle the armature (a). The end of this web forms a bearing (a′) for the driven shaft (S), the rollers (r) being inserted between the bearing (a′) and the shaft (S). The armature (a) is keyed to the end of the shaft (S) and overhung to bring it within the field. The shaft (S) is tapered at its end, and armature (a) is keyed to the tapered end and held in position by means of the bolt (g). The rotatable field (A) carries the collector rings (c), by means of which



ELECTRIC-TRANSMISSION MECHANISM FOR AUTOMOBILES.

current may be supplied to the field coils. The brushes (c′) are supported from the stationary field (B) of the second machine. This stationary field also has an extended web practically encircling the armature (b), and the end of which forms a bearing (b′) for the shaft (S). Spacing rings (s s) separate the rollers (r r). The armature (b) is also keyed to shaft (S) and is overhung similarly to armature (a). Stationary field (B) is provided with a flange (b^2), extending into close proximity to the revolving field (A) and serving to exclude dust from the collector rings and bearing. Field (B) is also provided with a dust ring (h), surrounding shaft (S). It will be seen by this arrangement that a practically continuous bearing for shaft (S) is secured through the entire transmission mechanism, rigidity of construction obtained, and maintenance of perfect alignment insured. Furthermore, the structure is practically self-contained, requiring outside support only for the stationary field (B).

Bids will be received by the city of Christiansburg, Va., until January 5th for a franchise to operate the electric-light plant in the city.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the **old address** as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own.* THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

REMITTANCES.—All checks, drafts and other remittances should be made payable to the order of the publishers, the **Electrician Publishing Company,** and addressed to the offices of publication, Suite 510, Marquette Building (204 Dearborn Street), Chicago, Illinois. U. S. A.

DATES AHEAD.

American Association for the Advancement of Science (annual meeting), Philadelphia, Pa., December 27th to 31st.

Northwestern Electrical Association (annual convention), Hotel Pfister, Milwaukee, Wis., January 18 and 19, 1905.

Independent Telephone Association of Wisconsin (annual convention), Hotel Pfister, Milwaukee, January 25th and 26th.

Ohio Independent Telephone Association, Columbus, Ohio, March, 1905.

National Electric Light Association (annual convention), Denver, June 6th, 7th and 8th, and Colorado Springs, June 9th, 10th and 11th.

OWNERS of isolated electric-light plants in the down-town district of Chicago gave evidence of satisfaction on the occasion, a week or so ago, when the breaking of a feed-water pipe in the Harrison Street plant caused the central-station lights to grow dim or even to go out altogether at a late hour in the afternoon when the State Street stores were thronged with shoppers. The lights in the business houses on the central-station mains were out or very dim, while the fellows with private plants had plenty of light and were doing business. Hence, sundry chuckles and exultation for the isolated-plant people. But there is another side to the story. Accidents to central-station service are very infrequent, but when they do occur they are known to all men. Breakdowns in isolated plants are much more numerous, but when they occur an emergency connection is usually made with the central-station circuits and current is secured at once. In other words, the greater possibility of interruption of service in the private plant is tacitly admitted in most cases by an emergency switch giving connection with the mains in the street. Not infrequently the isolated plants are in distress and call on the central station for relief, but nobody hears of it. The commercial lighting company, on the other hand, must rely on itself alone, and the greatest precautions are taken to insure continuous service for 24 hours a day. An accident seriously crippling the service happens so rarely that the possibility is almost negligible.

THE publication of the report upon "Electrical Methods of Thawing [Ice in] Water Pipes," prepared for the National Electric Light Association by Mr. George S. Haley, is, considering the season of the year, most timely and gives evidence of the enterprise of the association and the thoroughness of the author in gathering this data together and getting it into the hands of members of the association at a time when it will do the most good. Consideration of the report is given in this issue and among the most valuable things it contains are the diagrams and explanations illustrating the method of procedure to follow in thawing pipes by electric current. These explanations will be of especial value to central-station operators, who have thus far not made use of the process, and they are largely in the majority. A large number of letters were sent out by Mr. Haley to central-station managers who have made use of this method with resulting profit. The answers which they give contain much interesting information. In almost all cases the price charged has been a lump sum varying from $2.50 to $25 a service, the higher prices being charged in the larger cities. Few seemed to take the trouble to measure the current required and when an ammeter was placed in the circuit it was merely for the purpose of ascertaining an overload on the transformer. All voltages from 2.5 to 500 seem to have been used, the work being done as a general rule with apparently very little regard to current consumption. Alternating current only can be used with good results, as when direct current is used the effect is to expend the energy at or near the positive end of the pipe, which soon becomes hot while the other end remains comparatively cold. Nearly all of the transformers used were taken from the scrap pile, although one correspondent advised the purchase of a special transformer for the purpose. The secondary voltages used were about equally divided between 50 and 100. Fifty volts in some cases was found insufficient, but 100 volts was found to cover all cases regardless, however, of current consumption. The average capacity of transformers used was 15 kilowatts.

IT IS interesting to observe that the electric interurban railways are gradually compelling the steam-railroad companies to give them some recognition in the matter of the interchange of freight. A joint freight arrangement has been made between the Illinois Central (steam) railroad and the Aurora, Elgin and Chicago electric line, mention of which is made in the instructive article in this issue, entitled "Some Interesting Features of Aurora-Elgin-Chicago Electric-railway Operation." In other localities, too, the steam railroads are beginning to lose a bit of their hauteur and show a little disposition to treat with electric-railway companies in relation to both freight and passenger business. But in some states, like Indiana and Michigan, there is talk of appealing to the Legislature to compel the steam railroads to accept or deliver freight billed from or shipped to points on connecting electric lines. With the growth of electric railways it is obvious that the public will demand co-operation in many cases between existing steam roads and the interurbans. To them a railroad is a railroad, whether operated by steam locomotives or electric motors, and must perform its duties as a public carrier. This is of course the common-sense view of the situation and the steam-railroad companies might as well bow to the inevitable.

Several other rather unusual features of electric-railway operation are mentioned in the article—the sale of electric power to farmers along the line and the newspaper and milk delivery. The supply of electric power by circuits connected to contact and track rails is of particular interest, and we are sure that interurban railway managers will follow the experience of the Aurora, Elgin and Chicago with attention. Another important "wrinkle" is the use of calcium chloride on the third rail to attack ice on the third rail and to retard the further formation of ice. This method is reported to be successful, and thus one of the greatest difficulties encountered in operating third-rail lines in winter appears to be overcome.

MUCH of the hoped-for development of the Philippines depends upon the building up of intercommunication by the means of steam and electric railroads. To this end it has been strongly recommended that section 4 of a bill introduced in Congress on April 15th and now pending should be adopted. In brief, this section of the bill provides that for the purpose of aiding in the construction, equipment, operation and maintenance of railroads using steam, electricity, or any other power in the Philippine Islands, the general government of the islands be authorized to guarantee an income of not exceeding four per cent. upon cash capital actually invested in the construction and equipment of such roads. The guaranty shall apply and shall provide for supervision by the government of the conduct of the finances of the road and its location, construction and maintenance, as well as by the presence on the board of directors of two or more government directors, the number and manner of their selection to be determined by law. Provision is, however, made that the total annual contingent liability of the government—meaning the government of the islands—under the guaranties authorized by the section shall not at any time exceed the sum of $1,500,000, and that no such guaranty shall continue for a longer period than 30 years.

It was the opinion of the committee on insular affairs as well as of the secretary of war and the Philippine Commission that for the Philippine Islands it will be much better to have the railroads constructed under a guaranty upon actual investment and to have the lands held for the people of the archipelago. In the words of the committee report, "the building of railroads is the most important improvement possible for the Philippine Islands. The secretary of war testified before your committee that he knew nothing else which in importance is to be compared with it. More than all other influences combined, a comprehensive railroad system will do away with all the embarrassing variety of dialects and tribes in the islands and will bring about an early unification of the inhabitants—a condition absolutely essential to their highest prosperity and development. Railroads would greatly enhance the value of the lands and other property in the islands, enlarge their trade and increase the intelligence of the people."

Much interest has been shown on the part of serious American capital in the possibility of railroads in the Philippine Islands, undoubtedly predicated upon the assumption of the passage of the bill. Although undoubtedly a large part of this work when begun will be in the line of steam-road construction, the electric railway should come in for its fair share. Investigations which have already been conducted warrant the belief that 10,000 horsepower of available waterfalls exist within 50 miles of Manila. The Angot River, in the province of Bulucan, it is believed, will furnish 4,000 horsepower, and surveys have been made of the Bocotan Falls and several others. With an abundance of waterpower in sight, the electric railway will have a strong argument for its adoption.

Theory of the Electric Arc And Spark.

Members of the Electrical Section of the Western Socety of Engineers gathered at the society's rooms in the Monadnock Building, Chicago, on the evening of December 16th to listen to a paper by Prof. Henry Crew of Northwestern University upon "The Modern Theory of the Arc and Spark." In spite of the importance of the subject and the ability of the speaker, the attendance was rather disappointing.

Professor Crew, in his paper, presented in brief the theories which are now most commonly held to explain the phenomena attending the actions of the electric arc and spark. He presented the ionic theory as the most probable one from which to draw conclusions as to the cause of these phenomena, of which he named 13 which have been observed in connection with arc and spark discharges.

One of the things observed in connection with spark discharges is the very curious one of the spark being unable to pass from one electrode to another through a short space, whereas through a greater distance the discharge will occur. To illustrate this phenomenon, Professor Crew showed a diagram of an apparatus consisting of two glass bulbs connected by a narrow neck. A terminal of the induction coil entering each of the bulbs passed on through them and terminated in the neck, the spark gap between the two in the neck being one centimeter. The neck was separated from the bulbs by plugs, so that the gas in the bulbs might be brought to a higher pressure than in the neck. The bulbs were in turn connected by a long spiral tube. When pressure was applied to the two terminals a discharge was observed to occur from one electrode around through the spiral tube, which was perhaps nearly a meter in length, whereas no visible discharge took place through the spark gap only one centimeter in length. The explanation offered for this phenomenon was that in the gas as contained in the neck there are but comparatively few ions for the conduction of an electric discharge. Since the ions are enabled to conduct their charges by reason of their impact upon one another, there were sufficient of these ions in the comparatively large space of the spiral tube for them in their bombardment to transmit a slight current from one electrode to the other, lighting up the tube with a pale glow. On the other hand, the space only one millimeter in extent between the electrodes in the neck contained but a very few ions, or perhaps none, so that the collision between ions was not sufficient to produce a noticeable discharge.

Other peculiarities of the arc and spark which were dwelt upon in the paper were the formation of a crater at the anode in an arc; the much higher temperature of the anode; the fact that much less voltage is required to maintain an arc once started than is required for starting it, etc.

After the reading of the paper Chairman Hale called upon Mr. Carl Wiler to open a discussion of it. Mr. Wiler said that he had been much interested in the paper from the fact that many of the phenomena observed have a direct bearing upon the work of the arc-lighting engineer. He then went on to make some observations concerning the magnetite arc which he believes to be worthy of the most careful study.

Mr. George N. Eastman and Chairman Hale then asked some questions which were answered by Professor Crew, after which the discussion was closed.

Electrical Outlook in Detroit.

Detroit, Mich., is in rank the thirteenth city in the country, with a population of 336,000. In the manufacture of automobiles, of which the product this year will be not less than $10,000,000 in value, the various factories of the city make one-third of the entire output manufactured in America. The city has 385 miles of city and interurban electric street railways. The city has its own municipal arc-lighting plant, which is limited, however, by the terms of the charter to public lighting. The plant is valued at $825,000.

The Detroit Edison Company does all the commercial electric lighting and industrial-power business of the city. The Edison company property includes a tract of 38 acres of land on the banks of the Detroit River, accessible by four lines of railroad. Upon this site the Edison company has constructed a generating plant of the most modern type, having an initial capacity of 12,000 kilowatts and so planned as to be capable of extension from time to time to any capacity that may be required by the development of the business.

The new plant has recently been placed in operation and enables the company to generate its current at one point and distribute it economically by means of the five sub-stations. A well-constructed system of underground distribution is already in the commercial district. The demand for power, which the old stations lacked capacity to supply, makes available at once for the new generating plant a large amount of new business.

BOOK TABLE.

ENTWURF UND KONSTRUKTION MODERNER ELEKTRISCHER MACHINEN FUR MASSENFABRIKATION. (Design and Construction of Modern Electrical Machinery for Heavy Manufacturing). By Ernst Schulz. Hanover (Germany): Jänecke Bros. 1903. Pp. (seven by 10¼ inches), 132, with 110 illustrations.

This book is partially the result of original research made by the author with other purposes in view and partially the result of information he has gathered from the most up-to-date factories in his own country. The whole he has combined in book form, which he hopes will be of use not only for colleges as a textbook but for practical purposes as well. The latest methods for the design and construction of electrical machinery are embodied in the work and put together in convenient form. The work is divided into two parts, one devoted to direct-current motors and the other to induction motors. Under each are several chapters giving in minute detail the methods of design and construction employed in their manufacture, containing all necessary formulas, constants, etc.

ELECTRIC LIGHTING (Vol. I). By Francis B. Crocker New York: D. Van Nostrand Company. 1904. Pp. (6⅛ by 8⅞ inches), 482, with 213 illustrations. Price, $3.50.

This makes the sixth edition of Vol. I. of "Electric Lighting," which in itself speaks loudly in recommendation of this most excellent work, which, as an exposition of the general subject of generation of electric current, probably has few rivals. The first edition appeared in 1896, and from time to time the book has been revised to meet the rapidly changing methods and practices in the art which have taken place since that time. This last edition of Vol. I. is a practical rewriting of the book, bringing the various branches of the subject up to date, especially in the subject matter pertaining to steam turbines, gas engines, direct-connected units and storage batteries. Vol. I. is devoted exclusively to the generating end of electric lighting, including the engines, generators, switchboard, lightning arresters, etc., all in fact that pertains to the power plant. Transmission, distribution, etc., are left to Vol. II., which is of comparatively recent date.

ELECTRICAL TRANSMISSION OF ENERGY. By Arthur Vaughan Abbott, C. E. New York: D. Van Nostrand Company. 1904. Pp. (six by nine inches), 675, with 377 illustrations, including 16 full-page engravings and 109 tables. Price, $5.

Four editions have now appeared of this estimable work, the last being entirely rewritten and enlarged. To enumerate even the various subjects in the book requires a table of contents several pages in extent, and it may only be said in the short space here allowed that in this one volume is contained a careful analysis and treatment of all the elements which enter into the transmission of electrical energy from the properties of the wire itself to the design and construction of a high-tension transmission line or an elaborate underground system. The practical side of the work is given as careful consideration as the theoretical, even to the splicing of wires and laying of conduits. Numerous fine illustrations are a feature of the book. In a pocket in the back are contained 10 folding diagrams containing the results of an enormous amount of data worked up in the form of curves, from which information may be obtained directly, thereby saving the engineer designing a transmission system much laborious calculation. The method of inserting these curve sheets in a pocket in the book, while it is somewhat cumbersome and unhandy, is about the only way the curve sheets can be made of a size to make them of real value. Taken all in all this book is probably about as thorough and exhaustive a treatment of the subject of electrical transmission as any ever written.

ELECTRICAL FURNACES AND THEIR INDUSTRIAL APPLICATIONS. By J. Wright. New York: The Norman W. Henley Publishing Company. 1905. Pp. (5½ by 8½ inches), 288, with 57 illustrations. Price, $3.

Consisting essentially of a series of descriptions of various electric furnaces, this book is especially timely in view of the strides which have been made during the last few years in electrometallurgical processes. Some of the apparatus described, though it has never been put to practical use, is very interesting, indicating the steps in the development of the electric furnace to its present state and also the great ingenuity shown by inventors along this line. There is today hardly a metallurgical process requiring heat to which the electric furnace has not been applied, some times unsuccessfully, it is true, but at other times offering the only practicable solution of the problem. The illustrations in the book consist principally of sectional diagrams of the apparatus rather than views and are better adapted to show the interior parts than any illustrations taken from photographs could be.

Municipal Street-lighting Talk in New York.

The New York Board of Aldermen on December 2d passed a resolution calling for the preparation of preliminary estimates enabling the city to install and operate a municipal electric-lighting plant, plans for which have been under discussion since March. A large mass of statistics has been prepared on the subject, going back to the beginning of gas lighting in New York in 1823. Disregarding special cases, the average price of gas lighting has varied from $45 per street lamp in 1869 to $17.50 today. Public electric lighting commenced for Manhattan in 1881 at $225.50 per lamp. The price gradually decreased until 1890, since when it has remained steady at $146 for 2,000 candlepower arc lamps. Comparative tables of cost of street arc lighting by contract are presented from 175 American cities, the more important citations, for 2,000-candlepower street lamps, being:

City—	Underground Service.	Overhead Service.	Number of Lamps.	Term of Contract in Years.
New York	$146.00	$146.00	4,867	1
Chicago	137.50	103.00	5,308	1
Boston	120.45	120.45	3,670	5
Philadelphia	110.56	110.56	9,282	1
Providence	109.50	109.50	2,074	5
Baltimore	99.92	99.92	1,625	5
Milwaukee	99.00	81.00	1,812	5
Jersey City	....	97.50	1,402	5
St. Louis	96.38	96.38	968	10
Newark	95.00	95.00	1,950	5
Pittsburg	....	96.00	2,835	1
New Orleans	90.00	75.00	1,665	10
Louisville	....	84.00	1,758	4
Washington	80.00	....	965	1
Cleveland	75.00	75.00	1,098	1
Los Angeles	....	81.00	1,050	1

The estimates for a complete installation for public lighting in New York city, that is for streets and public buildings (it not being proposed to sell current to private consumers) are as follows:

COST OF CENTRAL STATION.

Boiler plant, for 10,000 horsepower, with economizers, stokers, superheaters, piping and foundations.	$500,000
Vertical engines, with condensers, foundations and pipings	325,000
Generating plant of 10,000 kilowatts, including exciters, switchboards, etc., erected	300,000
Building and excavations	250,000
Total	$1,375,000

This is equal to $137.50 per kilowatt, or more than the cost of the plant operating the New York subway.

COST OF PLANT.

Power plant as above	$1,375,000
High-pressure feeders	260,000
3,500-volt feeders (suburban)	40,000
Incandescent distributing circuits	90,000
Constant-current transformers for 12,000 incandescent ligbts	120,000
Constant-potential transformers, 7,500 kilowatts	75,000
Sub-station switchboards	75,000
Arc-ligbt cables and circuits	590,000
Distribution structures	50,000
Arc-lamp poles	495,000
Arc lamps and fixtures	250,000
Nine sub-station buildings	150,000
Real estate for sub-stations	105,000
Engineering and contingencies	370,000
Interest during construction	143,000
Total	$4,208,000

Cost of generation and distribution is given at $367,500 per annum, based, it is said, on a comparison of the statistics of the local electric companies, or an average cost of 1.27 cents per kilowatt-hour. With energy at this price and allowing $5 for maintenance, $20.20 for depreciation and $10.50 for interest, the total cost per annum for each 2,000-candlepower arc lamp would amount to $66.10. With similar allowances the cost per kilowatt-hour for each incandescent lamp would be 5.475 cents.

It is to be remembered, of course, that engineers' estimates are rarely borne out in practice by municipal operation. In few American cities having municipal electrical plants is the annual lamp-cost correctly stated in reports. In many cases it is not accurately known.

The final disposition of the New York municipal project lies with the state Legislature.

Death of Mr. W. Forman Collins.

Mr. W. Forman Collins, vice-president and business manager of the Electrician Publishing Company, died very suddenly on the morning of December 21st. Without warning, just on the point of arising from bed about 8 a. m., in his home in Chicago, Mr. Collins lurched forward and expired instantly in the arms of his devoted wife. It is believed that the bursting of a blood-vessel in the brain was the cause of death. Mr. Collins' colleagues on the Western Electrician are inexpressibly shocked by this sad calamity. They hold the press long enough to insert this brief announcement, reserving until next week's issue a suitable biographical sketch and portrait. In the mean time they offer their heartfelt sympathy to Mrs. Collins—the bereaved wife who in so real a sense was a helpmeet to her husband.

Echoes of the Telephone Convention.

Members and Visitors.

Of those who attended the Interstate telephone convention last week the following-named registered at the office of the secretary:

Ames, F. Z., Central Illinois Independent Telephone Company ..... Rutland, Ill.
Anderson, J. P., Madrid Ice and Telephone Company ..... Madrid, Iowa
Arterburn, C. I., Kansas Telephone Company.... Kansas, Ill.
Baker, A. S., Evansville Telephone Exchange.. Evansville, Wis.
Baker, Fred A., Evansville Telephone Exchange ..... Evansville, Wis.
Bandy, Geo. N., Brighton Telephone Exchange.. Brighton, Iowa
Barbour, Harry C., Ottawa Home Telephone Company ..... Ottawa, Ill.
Bauer, Gustave F. C., Century Telephone Construction Company ..... Buffalo, N. Y.
Bear, S. J., American Electric Telephone Company ..... Topeka, Kan.
Bellamy, J. S., Mutual Telephone Company.. Des Moines, Iowa
Berve, Lewis, Ogle County Telephone Company.. Rochelle, Ill.
Bochert, Otto, J. Andrae & Son & Co..... Milwaukee, Wis.
Boynton, E. D., Boynton Telephone Company ..... Pleasant Plains, Ill.
Brega, M. I., La Crosse Telephone Company. La Crosse, Wis.
Brooks, L. L. C., Tri-state Telephone and Telegraph Company ..... St. Paul, Minn.
Ferris, H. N., Kellogg Switchboard and Supply Company ..... Chicago, Ill.
Finley, H. D., North Manchester Telephone Company ..... North Manchester, Ind.
Fish, Frank M., Badger Telephone Company.. Milwaukee, Wis.
Fix, Ezra, Boswell Telephone Company..... Boswell, Ind.
Frazier, H. P., Hillsboro Telephone Company.. Hillsboro, Ind.

The New President.

Theodore Gary, the new president of the association is president and manager of six Independent telephone companies in Missouri and one in Kansas. He has lived in Macon, Mo., for 25 years, where he

THEODORE GARY.

has been active in the banking and real-estate business. He has also organized many corporations. Mr. Gary does all the buying for his plants, as well as the financing, and has personal charge of the operating of them. The systems in which he is interested operate 6,000 telephones in Missouri and Kansas. Mr. Gary is 50 years of age.

Convention Notes.

Mr. Mason did the honors for the Central Electric Company.

M. R. Nyman looked out for the Baird Manufacturing Company at the convention.

Mr. Kirkpatrick of the McRoy Clay Works was as usual in attendance at the convention.

That veteran of a score of telephone fights, James E. Keelyn, was there and was greeted by a host of friends.

Messrs. Morrell and Mietz appeared in the interests of the Measured Service Company of Chicago and presented a line of its meters in operation.

W. P. Bowring, secretary and treasurer of the C. H. Worcester Company, Chicago, was on hand and mingled with his friends and customers.

A. Meinema & Co., Union and Fulton streets, city, presented circulars of their selective ringing lockout system. Mr. Meinema was present in person to explain details.

"Manson" is synonymous with Okonite, and Okonite was most decidedly at the convention. Mr. Manson came from New York to be on hand and was warmly welcomed.

The group picture on page 506 is a reproduction of a photograph of the delegates taken in the meeting hall of the Auditorium during one of the sessions of the convention.

The F. Bissell Company, Toledo, Ohio, was this time represented by W. S. Bissell. Mr. Bissell was one of the most warmly welcomed among the supply dealers at the Auditorium.

Of course Mr. Hipwell of the Hipwell Manufacturing Company of Allegheny, Pa., was in evidence. Mr. Hipwell turned up on Tuesday morning and stayed throughout the entire convention.

General Manager Howard X. Foote, accompanied by M. V. Mehrey, was in attendance on Tuesday and Wednesday looking after the Eureka Electric Company's interests. Mr. Foote, however, made no attempt at an exhibit.

H. C. Dodge, Chicago, made an interesting exhibit at the telephone convention of what he calls "a cheap" electric sign. This sign has in it an automatic lamp flasher which turns the lamp on and off at regular intervals without a commutator mechanism, so to speak. The flashing arrangement is extremely simple, and through its use a cheap but efficient electric sign is produced. The lettering of the design may be changed by inserting perforated letters in front of the light.

Secretary R. K. Mickey of the American Carbon Battery Company of St. Louis was in attendance at the telephone convention. Mr. Mickey is an aggressive worker and has made his company felt in Chicago and vicinity.

The banquet which was announced as the wind-up of the convention was abandoned at the last moment. The Waukegan excursion tendered by the American Steel and Wire Company on Thursday afternoon to a large extent took its place.

Western Manager J. R. Wiley, suave, resourceful and obliging as ever, backed by his indefatigable associates, E. J. Pietzcker and W. M. Rogers, was as usual most graceful in doing the honors for the Standard Underground Cable Company of Pittsburg.

The Standard Telephone and Electric Company, Milwaukee, Wis., came to the front with a number of interesting advertising cards explaining the well-known fact that Standard telephones are "money makers." A souvenir was presented in the form of a telephone button.

"Burch of Madison" as usual came early and stayed late and gave the strongest evidence of his favorite expression, "Not as big as the biggest, but as good as the best." Mr. Burch has recently gone into the telephone business in the Northwest and is meeting with much success.

President Joseph Belden of the Belden Manufacturing Company was daily to be seen during the entire convention period. Mr. Belden has built up a prosperous magnet-wire business in Chicago and recently the company has decided to extend its factory on the North Side over a much larger area.

The XXX Electric Supply Company, through its general manager, W. A. Frick, gave a number of important reasons why one should use the XXX test and wire connector. As there are about 14 points of merit claimed for this simple device, it would seem to be worth an investigation on the part of telephone and electric-light linemen.

President Frank G. Jones of the American Electric Fuse Company created a sensation by his distribution of a most strenuous advertisement. Mr. Jones is an energetic and popular manager of a business that of late years has been built up to a remarkable degree. His methods are usually forcible and striking and appeal to telephone people.

Secretary and Treasurer William M. Smith turned up on Tuesday and did the honors for the Chicago Insulated Wire Company. Mr. Smith and President Turlay of the company are ever-welcome guests at all electrical conventions. Mr. Smith reports the wire factory at Sycamore, Ill., as running full blast with a most excellent business behind it.

Frederick L. Merrill, Omaha Building, Chicago, the Chicago and district manager of the Dielectric Manufacturing Company, appeared at the convention in the interests of the Dielectric standard insulating materials. Dielectric products have now become standard among many of the most prominent electrical manufacturers of the United States.

Secretary and Treasurer M. J. Berger of the Vought-Berger Company, La Crosse, Wis., came early and stayed late at the convention. Mr. Berger is one of those enterprising men of the Northwest who from small beginnings have built up prosperous manufacturing companies. The Vought-Berger telephones and switchboards have met with much favor among exchange men.

I. A. Bennett, the popular manufacturers' agent of the Monadnock Block, Chicago, was daily on hand. Mr. Bennett made his reputation as one of Chicago's most skillful advertisers by his brainy and novel advertising schemes presented at a telephone convention. This time, however, Mr. Bennett made no special effort beyond keeping in close touch with what was going on at the Auditorium.

LeRoy W. Stanton, the well-known telephone engineer of the Middle West, was among the prominent ones of the telephone convention. Mr. Stanton at the present time is an exceedingly busy man, and, owing to the large amount of work in his charge, is often absent from his headquarters in Cleveland. He was warmly welcomed at the convention, but was unable to be on hand longer than two days.

The Gray Pay Station Company of Hartford, Conn., made a most interesting exhibit of various kinds of pay stations. The Gray company made a specialty of the exhibition of an "outdoor" pay station. It incidentally may be said that the Gray Pay Station Company is one of the oldest pay-station companies in the United States and, in fact, it was in the pay-station business years before Independent telephony came to the front.

J. H. Montague together with G. H. Pierce and A. B. Chance looked after the interesting exhibit of the Ericsson Telephone Company of New York in a thoroughly efficient manner. The Ericsson company this time presented some very meritorious apparatus. The Ericsson common-battery line relay was an object of much interest on the part of the delegates. This relay was set up to work on about 20 volts through the resistance of the human body; in fact, handles were provided to illustrate the working of the apparatus through the body. A very novel test was presented by connecting six men in series, giving an estimated resistance of 54,000 ohms, to the relay and operating it through this artificial resistance. The company also presented for inspection a 200-line self-restoring indicator switchboard; also a four-party selective system. The strongest claims are made for this latter system, which is said to be non-interfering and not to depend on a frequency or step-by-step principle.

J. Loud presented an interesting linemen's specialty for the Walton Self-locking Block Company. The self-locking block and tackle shown by Mr. Loud met with favor. This block and tackle has the peculiar feature that as the rope is pulled taut it automatically locks itself in the block so that all a lineman has to do is to pull. This specialty is well worth investigating on the part of linemen desiring a load holding block and tackle in which the rope can be locked at will.

The Fibre Conduit Company of Orangeburg, N. Y., with western offices at 1760 Monadnock Building, Chicago, exhibited an extensive line of socket-joint conduit in sizes from 1½ inches inside diameter to four inches inside diameter. Particularly interesting in this exhibit was a piece of conduit which had been buried in the ground 10 years without concrete and which shows no deterioration whatever. Bulletin cards of an interesting nature were distributed. W. W. Smythe, Jr., western manager, was in charge.

Vice-president and General Manager John S. Speer of the Speer Carbon Company was in attendance. Mr. Speer usually makes a business trip about this time of the year in the interest of his carbon company at St. Marys, Pa., and availed himself of the present occasion to "take in" the telephone convention. Mr. Speer reports local business in St. Marys as being in a most prosperous condition. Mr. Speer, as is well known, is manager and head of the new local opera house, the St. Marys lighting plant, and has recently become one of the prime movers in an electric-railway enterprise connecting St. Marys with an adjoining city.

Pearne, Krum & Co. came to the front and utilized the opportunity of the convention to present for the inspection of exchange managers the newest thing in telephony, the Pearne automatic flashlight transfer. The switchboard in which this system was embodied was shown in operation in the Railway Exchange Building, and from the number of telephone engineers that inspected this apparatus it is safe to say that the exhibitors were repaid for their pains. The details of this automatic flashlight-transfer system are as yet not ready for publication, but many operators express themselves as highly pleased with its operation in actual service.

The National India Rubber Company, through its hard-working representative, P. F. Lyons of Bristol, R. I., was at the Auditorium during the entire convention period. Mr. Lyons reminds western patrons of his company of the important fact that the National India Rubber Company now carries a most extensive and varied stock of its rubber-covered wires in its Chicago warehouse at 244 Monroe Street. For a long time the National company has felt the need of a large western stock at the center of the western market and this move in locating large warerooms in Chicago is not only greatly to its credit, but has resulted in a large increase in business where quick shipments from stock are desired.

Among the prominent representatives of large telephone properties was General Manager W. H. Butler of the Portage County Telephone Company, with headquarters at Ravenna, Ohio. Mr. Butler is one of the most experienced men in the Independent telephone field, a graduate of Yale in the class of '90, and incidentally, it may be said, the fastest single-scull oarsman that had ever raced in an intercollegiate contest up to '90. He began early in the telephone business and has been most successful. The Portage company has exchanges at Kent, Ravenna, Mantua, Garretsville and Streetsborough. In addition to these prosperous exchanges the company has now in prospect another exchange at Atwater, Ohio.

A. L. Waterbury, the popular general manager of the sales department of the American Conduit Company mingled with the "boys" at the Auditorium. The American Conduit Company's electrolysis-proof bituminized fiber conduit has met with remarkable success in underground telephone-construction work. The company now has factories located at Los Angeles, Cal., Chicago, Ill., and Chester, Pa. Not only is the conduit used extensively by telephone companies but it enters enormously into general electric-light and power construction. General Manager A. L. Waterbury reports the company in a most prosperous condition. Incidentally it may be mentioned that Secretary Buchanan of the Conduit company recently left to locate himself at the Los Angeles factory until early spring.

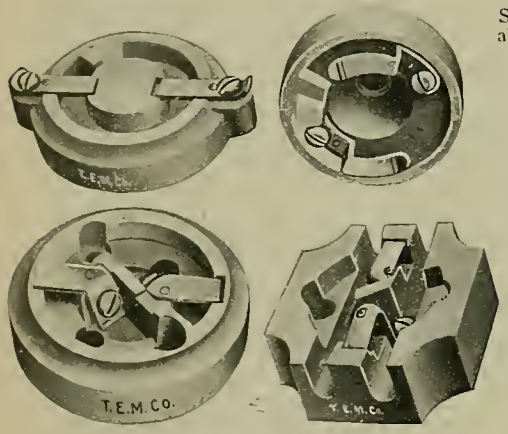
The Stombaugh guy anchor was efficiently represented by Claude L. Matthews, junior member of the enterprising firm of W. N. Matthews & Bro. of St. Louis, the manufacturer of the Stombaugh. Everybody had a card with the words "Have You a Pull" printed in white on a sable ground. On the back was the information that the Stombaugh guy anchor will hold any pull that occurs on the poles of telephone companies and that the Stombaugh guy anchor is extensively used by many prominent telephone companies. Mr. Matthews had on exhibit all of the different size Stombaugh anchors that his firm makes. He also had a series of inter-

esting photographs showing the different uses to which the Stombaugh guy anchor could be put. One of particular interest showed a case where the anchor was bored in under a granitoid sidewalk, saving the great expense of pulling up the sidewalk and relaying it in order to bury a "deadman." On the whole the exhibit of Stombaugh guy anchors was very interesting to the telephone men.

The exhibit of the Central Telephone and Electric Company of St. Louis was one of the most beautiful at the convention. The company's line comprises five, four and three-bar types of instruments, the woodwork being of a very beautiful finish, comprising ebony, mahogany, Flemish oak and quarter-sawed oak. In the exhibit was the Central's original Leader type of telephone, the transmitter being opposite the mouth and the generator at the height of the elbow, with the switch-hook at the same height, allowing the comfortable use of the telephone. The Central company also showed a new type of transmitter, the diaphragm of which is all of aluminum, with polished carbon electrodes and the best imported granular carbon. The main feature of this transmitter is its non-rupturable diaphragm of aluminum. This transmitter is said to be free from packing and its articulation is clear and distinct. The long-distance telephone shown by the company will, it is said, talk over any length of line regardless of transpositions and induction coils. This instrument represents five years of hard, conscientious labor on the part of its inventors, Messrs. Gradolph and Hahne. The Central Telephone and Electric Company was represented by J. S. Cuming, president of the company, and W. F. Gradolph, engineer.

Fuseless Rosettes.

The accompanying illustrations show three types of fuseless rosettes and one type of cap as manufactured by the Trumbull Electric Manufacturing Company of Plainville, Conn. The rosettes are provided with spring tongues in the caps, which allows them to be fitted with cord and "snapped" on after the base is in position.



FUSELESS ROSETTES.

A quarter turn of the wrist does the work. Another feature is the stop in the cap, which allows it to be put on one way only. For arc-light work this is invaluable, as there is no possibility of reversing the current by taking off the rosette cap.

Caps are interchangeable and will fit any style of base. The hole in the cap takes the new code cord.

Guthrie Sign Flasher.

As will be noticed by a glance at the cut, the Guthrie sign flasher, for which the A. S. Doxsee Electrical Company of St. Louis is the general agent,

GUTHRIE SIGN FLASHER.

is enclosed in an iron box. This box is eight by five by five inches, and is so arranged that it can be readily attached to the wall. The box is lined with slate and the binding posts are located on the top so that it is easily installed. The flasher is operated by an extra-heavy special spring motor, which runs from 10 to 12 hours with one winding. All contacts are made of platinum, while all switches are of ample carrying capacity, rated at six amperes per switch. The break can be readily adjusted to operate it in any manner desired. All working parts, binding posts, etc., are distinctly high-grade in material and workmanship.

Advocates of this type of flasher point out that, once installed, it needs no more attention than the periodical winding. Further, it costs practically nothing to operate, as there is no electric motor to consume current. The outfit is compact and simple, and the Doxsee company gives a guaranty for 12 months against any mechanical or electrical defect. All flashers are sent out accompanied by a wiring diagram, and it is reported that they have given entire satisfaction.

4,000-kilowatt Alternators to Be Driven by 6,000-horsepower Gas Engines.

The California Gas and Electric Corporation, San Francisco, Cal., has just placed an order with the Crocker-Wheeler Company, Ampere, N. J., for three 4,000-kilowatt, three-phase, 13,200-volt, 25-cycle, 83-revolution, revolving-field alternators, to be driven by 6,000-horsepower gas engines built by the Snow Engine Company. These generators are to be the largest in capacity in the world driven by gas engines, and will furnish reserve capacity for operating all the street railways in San Francisco and vicinity, as outlined in the Western Electrician last week. This important sale by a company which has been building alternating-current machinery only a few months is indeed a cause for congratulation. It is due in part to the fact, as announced several months ago, that the Crocker-Wheeler Company is the American licensee of Brown, Boveri & Co., the celebrated Swiss electrical engineers. But the reputation for excellence which the Crocker-Wheeler Company has built up during the last 16 years of manufacture of direct-current apparatus has had much to do with the result.

Vertical Single-phase Motor.

The Wagner Electric Manufacturing Company of St. Louis has just added to its line of single-phase alternating-current power motors a neat type of vertical single-phase motor, an illustration of which appears herewith. The special field of application for such a motor is for driving centrifugal pumps and work of similar character. In its general construction the motor corresponds electrically to the well-known forms of Wagner single-phase motors heretofore on the market. Mechanically, the introduction of ball bearings, etc., are distinguishing features, resulting in an excellent efficiency and quiet running of the motor.

VERTICAL SINGLE-PHASE MOTOR.

The Wagner company is prepared to make immediate deliveries on 10 and 15-horsepower sizes, for 60-cycle service. The windings are for 110, 220 or 500 volts, and the speed 1,150 revolutions a minute.

West Shore Road to be Used for Electric Cars.

The Andrews-Vanderbilt trans-state trolley road officials have practically decided, it is said, to use the West Shore railroad from Eastwood to Chittenango, N. Y., exclusively for electric cars and to send the freight which is now hauled over the West Shore road between those points over the main line. From Chittenango to Canastota the plans are to use the West Shore tracks for both freight and electric cars. The plans for the road between Eastwood and Syracuse have not been matured. There is a possibility that a new road will have to be built between those places.

Where the freight and trolley cars run over the same tracks the block system will be used. The electric cars will be equipped with side trolleys instead of a standard extending from the top of the car. The wires will be strung from short poles, reaching to the middle of the cars.

Horace E. Andrews of Cleveland, who is at the head of this system, was in Syracuse recently attending the annual meeting of the Syracuse Rapid Transit Company. Speculation is rife in Syracuse as to what connection Mr. Andrews has with the road which is being built between that city and South Bay, on Oneida Lake. It is understood that Mr. Andrews is a stockholder in the Cleveland Construction Company, which was recently incorporated to undertake the work of building the road, and which bought Frenchman's and Dunham's Islands, the Sagamore Inn and other real estate in the vicinity of Oneida Lake.

The plans of the construction company are of great magnitude. It has been announced that a line of boats will be run along Oneida Lake between South Bay, Sylvan Beach and other points, and that a big dock will be built at South Bay to accommodate freight and passenger traffic. It is said that the plan is to have the boat line connect with the trolley roads at the east and west ends of the lake.

The Power Plant of the Tall Office Building.[1]

By S. H. Bunnell.

The limit of excellence in steam-engine economy stands at about one horsepower produced per pound of coal burned per hour. This duty is only reached by large and thoroughly well-built engines under the most favorable conditions of uniform load, high steam pressure and good vacuum in condenser. Between this remarkable figure and the actual every-day performances of the high-speed engines necessarily used in the restricted spaces of the engine rooms of large city buildings there is a very wide gap. The problem before the designers of power plants of the latter class is to make the best use of steam received at moderately high pressure and delivered into heating systems at a pressure more or less above the atmosphere, with the advantage of atmospheric exhaust only during some five months of the year. The engines using steam under these conditions must develop powers widely varying from small percentages of the full load up to the greatest overload capacity which may be required when nearly all of the elevators of the building happen to be taking their several maximum amounts of current. Together with these requirements, it is demanded that the regulation of the engines shall be practically perfect, as measured by the production of incandescent electric lights without perceptible fluctuation.

For these conditions high-speed engines are almost invariably required and selected. These engines are of three principal types—the simple single-cylinder engine with single steam valves, the single-cylinder engine provided with four valves of Corliss or slide type, thereby separating the inlet from the exhaust and giving practically the economy of the regular slow-speed engine of Corliss type, and the non-condensing compound engine, usually provided with a single valve for each cylinder, but sometimes having separate steam and exhaust valves on one or both cylinders. In most cases these engines seem to be designed to handle the maximum loads of the generators directly connected to them, without much regard to their probable performance in the matter of economy and use of steam when running under loads much below the maximum. It is evident that with exhaust back pressure not less than atmospheric pressure, and most of the time considerably more than this, the number of possible expansions or the ratio of initial to terminal steam pressure is limited to a figure which is not unsuitable for simple engines. Since steam expansion cannot be economically carried below terminal pressure without a waste of developed power shown by the formation of a negative loop in the indicator diagram, the minimum power economically developed by the non-condensing engine is that due to the mean effective pressure consequent upon making the terminal pressure equal to the back exhaust pressure. From this minimum the power can be increased without limit until the engine is taking steam full stroke and operating without expansion. A division of the possible diagram into two separate diagrams by compounding is at the expense of more or less of a gap between the two diagrams thus produced, due to valve friction, condensation in receiver and other losses, the only compensation for which is the decreased range of temperature between inlet and exhaust in the separate cylinders, compared with the range existing in the single-cylinder engine with the same inlet and exhaust pressure. As a matter of fact indicator cards and tests from compound and simple non-condensing engines under the conditions existing in the power plants of city buildings show that the employment of compound engines for this service often gives results inferior to the performance of single-cylinder engines with better valve gear and costing considerably less to construct.

Some time ago Mr. Isaac D. Parsons made a careful study of the conditions of operation of a number of power plants of the class under consideration. His figures were selected as the best and most definite obtainable by an investigation which covered very many buildings and plants differing widely in details, sizes and conditions. Data obtained from 17 plants whose records were accurate and complete were tabulated in convenient form for determining the actual cost of current as compared with the rates charged by central stations. The items making up the cost of current were taken to be labor, coal and handling of ashes, water, lamps, oil and supplies, repairs, central-station service

1. Abstract of a paper presented at the New York meeting (December, 1904) of the American Society of Mechanical Engineers.

where used for periods of minimum consumption to allow of shutting down plant, and interest and depreciation at six per cent. per annum on original cost of plants. Roughly these figures average labor one-third, coal one-third and interest and depreciation one-tenth to one-third, the sum giving the cost of power being made up by the items of minor expense. The amount paid for labor does not depend closely upon the details of the plant installed, except that simplicity of machinery would tend to decrease the cost of labor necessary properly to operate it. A saving in the cost of current would, therefore, be necessarily made chiefly by decreasing the consumption of coal and the first cost and expense of repairs to the machinery.

The accompanying table is adapted from Mr. Parsons' figures, which were published in the Engineering Magazine of January and February, 1902. The last column gives the ratio of the maximum momentary load which might be caused by the simultaneous starting of all the elevators to the minimum lighting load existing during the hours of bright daylight. The extreme ratio shown in any of these buildings is that of No. 4, where the minimum load is (supposing the operation of both elevators during daytime) only four per cent. of the maximum capacity which may be suddenly called for. This, however, is an extreme figure; from 10 to 20 per cent. seems more representative of the minimum load required to be carried by the power plant. It is evident that the mean of the load carried throughout the day by any of these engines would be about one-half of the full load, and that the engines should be designed for best economy at some point considerably below their maximum power, and to operate with reasonable efficiency over a wide range of load. While this is true of all engines of isolated plants for furnishing current to buildings, it is especially the case in the larger plants, since the steady lighting load of office buildings is considerably below the maximum, and the maximum load is only required for an hour or two in the afternoon during the winter months.

These figures [in a table not given in this abstract] indicate that the single-cylinder four-valve engine has a far greater range of capacity with reasonable economy than the non-condensing compound engine, and for the actual conditions of service in power plants of large buildings is much to be preferred. It would seem very desirable that engineers planning power installations of this character should make a careful study of the probable actual running conditions under which current must be furnished, so as to select engines designed to give the best economy under actual conditions instead of, as is too frequently done, letting contracts on the basis of the best load performance guaranteed, in spite of the fact that in buildings where most of the electric current generated is used for power by the various auxiliary machines and the elevators, the full-load capacity is only infrequently and momentarily required.

Electric Mine and Quarry Drill.

The Adams all-steel electric drill, the electrically driven drill shown in the accompanying illustrations, which is manufactured by the Gardner Electric Drill and Machinery Company, Cleveland, O., offers an example of a successful electrically driven rock drill. Mr. Adams, already well known to central-station men as the Mr. Adams of the Adams-Bagnall Company of Cleveland, has profited by the experience of others less fortunate, and in a measure reaped the benefit of their failures. There has been no attempt to work upon impossible lines or create a theoretical product, incapable of standing the test of practical application, but rather a machine that could take its stand by the side of the modern air drill, possessing a similarity of action and appearance, although entirely different in mechanical construction, and capable of doing as much work in the same time as any air drill of equivalent size, with about one-fifth of the power, and doing this, not merely in trials against time, but in steady everyday use.

Fig. 1 of the accompanying illustrations shows the drill mounted on a tripod, while Fig. 2 shows the drill mounted upon a column.

To equip a plant with the Adams all-steel drills, one requires the drill outfits; an engine capable of supplying three horsepower for one machine; five horsepower for two, or if more than two drills are used, then two horsepower for each machine; a generator of equal capacity for supplying the current to run the drills, and sufficient wire to reach the workings and return, with a few extras, such as switches, insulators and brackets for stringing the wires. If current can be obtained from an existing power circuit, the engine and generator are not required, which dispenses with the services and expense of an attendant.

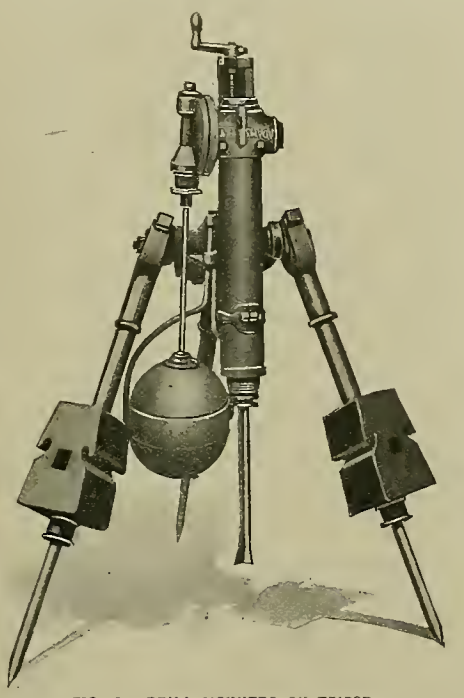

FIG. 1. DRILL MOUNTED ON TRIPOD.

One of the best features of the Adams all-steel drill is the simplicity of its mechanism. The drill is actuated by a loose rod, running through the gear case and motor, and this imparts motion through a pair of bevel gears and crank shaft to the drawbar and piston, the latter being cushioned with gangs of helical springs, which serve to absorb the shock of the blow, to protect the parts from injury, and also to store up energy on the back stroke, which it can expend in forcing the steel into the rock.

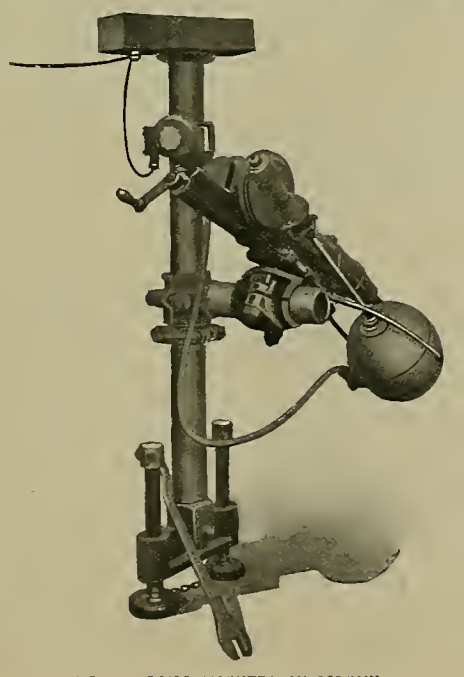

FIG. 2. DRILL MOUNTED ON COLUMN

These springs also prove extremely useful, when using the bit as a reamer or to pull it out of a fissured hole, and are strong enough and so arranged that it makes it almost impossible to stick the bit in any kind of hole in any kind of ground. The drill can also be run freely without any damage whatever, and reaming holes is therefore an easy proposition. The drill strikes from 575 to 600 blows per minute. Among the main features claimed for the Adams all-steel electrically driven rock drill are the following: There is no flexible shaft required; the current does not enter the drill; it is not affected by extreme cold weather, an important feature in its favor. It may be operated in quarries, open rock work and shallow mines where steam or air drills "freeze up." There is no delay with the Adams drill from this source of annoyance and expense; no injurious effects can be experienced if a miner comes in contact with the wires, because low voltages are used, generally 110 or 220; the drill can be turned upside down for putting in lifting holes.

Telephone News of the Northwest.

A company of which H. J. Bergman is president has been formed and will open a telephone exchange at Edinburg, N. D.

The Minnesota Central Telephone Company has completed rebuilding and improving the line from Willmar, Minn., to Morris, and now has a complete metallic circuit from the Twin Cities as far west as Morris.

The council of Moorhead, Minn., reconsidered granting the Tri-state Telephone and Telegraph Company permission to string wires across the city and refused it. The company is proceeding with setting poles for a line through the city, and litigation will follow.

The Marion Telephone Company of Marion, S. D., which recently absorbed the Steninger exchange there, has been incorporated with a capital of $10,000.

The council of Rochester, Minn., has granted a toll-line franchise to the Tri-state Telephone Company.

The Minnesota Central Telephone Company will install a local exchange at Kerkhoven, Minn.

The Rural Telephone Company of Morton, Minn., has built lines to Beaver Falls, Olivia, Morton and Franklin.

The Minnetonka Telephone Company of Excelsior, Minn., has been sold to the Northwestern Telephone Exchange Company of Minneapolis. The transfer occurs January 1st.

The Wisconsin Telephone Company has agreed with the Citizens Telephone Exchange at Sheboygan, Wis., whereby the former retires from the local field and the latter uses the former's long-distance service and rents Bell transmitters.

A telephone system is projected by Indiana Agent Michelet at White Earth, Minn., to the government schools at Mahnomen, Beaulieu and Porterville.

The Farmers' Mutual Telephone Company has been incorporated at Reading, Minn., with $25,000 capital stock, to build a rural system to cover the county.

The Belgrade and Southwestern Telephone Company has been formed to build a line out of Belgrade, Minn.

A special election will be held at Parkersburg, Iowa, on January 7th to vote on a proposed franchise for the Farmers' Mutual Telephone Company. The proposition is opposed by the Parkersburg Telephone Company.

The Iowa Telephone Exchange Building at Keokuk, Iowa, was so badly damaged by fire that new quarters will have to be secured before the system can be placed in working order.

The Independent Telephone Company will construct a new rural line out of Blue Springs, Neb., at once.

The Farmers' Mutual Telephone Company has been voted a franchise at Moulton, Iowa. R.

Indiana Telephone Items.

The Liberty Telephone Company has incorporated with a capital stock of $20,000. The company is organized to install and operate telephone lines in Union, Fayette, Wayne and Franklin counties, Ind., and Butler and Preble counties, Ohio. The principal exchange will be in Liberty. W. A. Bryson, Daniel Rousier, B. M. Grove and James Allen are among the incorporators.

The Amboy Home Telephone Company of Amboy and the Uniondale Rural Telephone Company of Uniondale have increased their capital stock materially for the purpose in each case of making improvements and extensions. Noah W. King is president of the former company and V. M. Hatfield of the latter.

The Standard Bracket and Pin Company of Madison has been incorporated. The capital is $12,000. The company proposes to manufacture and sell arms, brackets, pins, etc. A. L. Schmidlap, G. W. Cofield, B. F. Head and B. F. Law are the incorporators.

The ordinance granting the Central Union Telephone Company a franchise to do a local business in Lebanon has been vetoed by the mayor on the ground that it failed to stipulate the price at which service

would be furnished. A new ordinance will now be introduced providing for a schedule of rates.

The Central Union Telephone Company has applied for a franchise to do a local business in Franklin. The citizens are said to be satisfied with the service given by the Franklin Telephone Company, which has 800 telephones in operation and gives free connection with seven Independent companies. Patrons can talk with nearly every city in the state, and for these reasons a dual system is meeting with opposition.

The Indiana Independent telephone men are encouraged over the prospect of securing long-distance connection with Chicago. They say they will now put their plants in condition to meet the requirements named by President Wheeler of the automatic system in Chicago, and are hopeful of making the much-desired and long-delayed connection. S.

Michigan Telephone Matters.

Business men and other patrons of the Michigan Telephone Company in Benton Harbor and St. Joseph are in revolt because of the notice given that after the first of January a rental of $30 per year will be charged for telephones in business houses. The old rate is $18. Dissatisfaction is so pronounced that there is some talk of the organization of an Independent company. Several months ago the Michigan company and the Twin City company effected an agreement whereby the former was given absolute right to do business in St. Joseph, the latter in Benton Harbor.

The Co-operative Telephone Company has issued a circular in which it says that the Bell people have reduced rates between Detroit and Toledo because the latter are beginning to feel the effect of the Co-operative competition. President W. A. Jackson of the Michigan State Telephone Company is in the East and General Manager Land could not be reached, but General Superintendent H. H. Robinson said he does not think there has been any cut, though he is not certain, because he has been away from the city for a few days. W.

British Postoffice Department and Village Telephones.

An account of an experiment by the British Postoffice Department pertaining to telephones at village postoffices has been written by United States Consul Liefeld at Freiburg, Germany. It is as follows:

"An important experiment which may have far-reaching results is being made by the telegraph department of the general postoffice in half a dozen villages. The object is to ascertain if it is practicable to make village postoffices serve the purpose of public-telephone call offices. If successful, the result will be the removal of one of the disabilities attaching to life in villages.

"For the last six years, although the fact is not generally known, it has been the practice to use the telephone, which officially is a telegraph instrument, to transmit telegraph messages from town centers to small village postoffices. The installation of a telephone wire is cheaper than the telegraph installation and the messages can be sent more expeditiously than by the needle instrument or the A-B-C code, the methods generally used in village postoffices. The messages are written out and stamped by the sender and are sent over the wire by the clerk.

"In the selected villages it is now possible for any member of the public to ring up a subscriber and use these postoffice telephones in the ordinary manner at the ordinary rates. Should the person with whom communication is desired not be on the telephone line the sender can telephone his message to the nearest postoffice and have it sent on by express messenger. In the case of long messages the saving in expense as compared with sending the same message at telegraph rates will be very considerable. Similarly the town dweller will be able to communicate with the villager. The point to be decided is whether this new arrangement meets a real public want."

NEW COMPANIES.

The Delmar (Kan.) Mutual Telephone Company has been incorporated.

The Blue Rapids (Kan.) Telephone Company has been incorporated with a capital stock of $12,000.

The Beverly Telephone Company of Beverly, Kan., has been incorporated with a capital stock of $3,000.

P. R. Smith, William Blair and L. D. Jones of Waketa, Okla., have incorporated as the Grand Valley Co-operative Telephone Company.

A company is being organized in Covington, La., for the purpose of installing a telephone system. H. H. Smith and Paul Labordi are among those interested.

The Cherokee Telephone Company has been permanently organized at Gaffney, S. C., with T. G. McCraw, president; J. V. Whelchel, vice-president, and J. E. Jeffries, secretary.

The Western Telephone Company of Ozark, Ark., has been incorporated with an authorized capital of $100,000. Among those interested are J. F. Maxey, W. H. Fulker and L. D. Huggins. The company proposes to construct and operate telephone systems.

How Avoid Personal-injury Responsibility in Telephone Construction Work and Maintenance.[1]

By Rome C. Stephenson.

It would be impossible to lay down a set of rules to govern a telephone company which, if faithfully observed, in the construction of a plant, would avoid responsibility for personal injuries. In the larger cities where it is necessary to have a force of linemen at work constantly in making repairs and extensions the liability of some workman being injured by a fall from a pole or by coming in contact with a live wire is ever present. A large percentage of the injuries sustained by linemen result from falls received through defective cross-arms which are unable to stand the burden placed upon them. If possible it should be ascertained that all cross-arms used are made of first-class material, free from knots and decay, but as they are usually painted before being delivered, too much care cannot be exercised in the inspection.

The liability of a company for personal injury received on account of a defective cross-arm is much greater where the arm did not show an apparent defect than where the defect was easily observable. If the person injured could by the exercise of ordinary care have seen the defect and the injury resulted from his negligence, the case would be one of mutual fault and the law would neither cast all the consequences upon the company nor would it attempt any apportionment thereof, so there would be no legal liability on the part of the company. But where a lineman is injured on account of some defect in the material used by the company that could not be seen prior to the accident by the exercise of ordinary care, but which defect was known to the company, then the law places upon the company the responsibility for the injuries sustained by its employe while engaged in the performance of his duties.

Neither individuals nor corporations are bound as employers to insure the absolute safety of material or appliances which they provide for the use of their employes. Nor are they bound to furnish the best and safest or newest of those appliances for the purpose of securing the safety of those who are employed. They are, however, bound to use all reasonable care and prudence for the safety of those in their service by providing material and appliances reasonably safe and suitable for the use of the latter. It is, therefore, important that all material to be used by the company wherein defects might cause an accident for which the company would be liable should be carefully and thoroughly inspected by a competent and reliable superintendent prior to its use.

In the work of construction and extension of telephone lines extraordinary care should be taken to keep the telephone lines, as far as possible, away from all electric lines carrying a heavy current, and where the crossing of such lines by the telephone wires is unavoidable it would be prudent in erecting the telephone wires to pass over the heavy-current lines with a space of at least four feet between. In places where it is practical to do so guard wires should be erected below the telephone lines as an additional measure of precaution.

The courts have time and time again decided that the electric-light and trolley wires should be erected in such manner as not to interfere with the service of the telephone system. Where a telephone company operates its line by the single-wire system, in which the earth is used as the return conductor at the telephone exchange and at the houses of each of its subscribers, and the electric currents required for its business cause no hurtful disturbance of natural electrical conditions, and where an electric-railway company operates its road by the single-trolley system, in which it also uses the earth as a return conductor, but generates electricity in such unusual quantities and applies it in such violent and varying currents as to produce an unnatural and disturbed electrical condition, whereby the utility of the telephone plant is destroyed by conduction, the court has held that the railway company is liable to the telephone company for damages to its business.

In running telephone wires it is unavoidable in many instances to prevent them from running near high-current wires, and as telephone wires are liable to become loosened, slacked or come into contact with live wires from other cause, it would be prudent and have a tendency to prevent accidents for which a company would be liable if a regular and systematic inspection should be made of all telephone wires at points where they would be likely to come in contact with live wires.

The dead telephone wire is always one of danger and menace, and when a wire is not in use it should always be disconnected from the building and securely fastened up out of reach so that if it should become a live wire it would not be likely to cause injury. Where a dead wire passed over a trolley line and by sagging came in contact with it and the end of the wire had been allowed to hang for several months within the reach of a person standing on the ground, a telephone company was held liable for the death of one caused by contact with the loose end.

1. Abstract of a paper read at the convention of the Inter-state Independent Telephone Association in Chicago on December 15th. The author is connected with the Rochester Telephone Company of Rochester, Ind.

The Rochester Telephone Company of Rochester, Ind., is now involved in litigation to determine whether the company is responsible for the death of a farmer who was killed by a stroke of lightning. The man was standing 40 feet beyond the termination of a wire fence which ran down to the public highway over 200 feet away, along which highway one of the toll lines of the company had been constructed. After the man was killed it was found that a bolt had also struck some fence posts along the road several hundred feet away, and the telephone wire disclosed the fact that an electric current had also passed along it, as the wire was melted off at the point just opposite the place where the wire fence connected with the fence running along the highway. The complaint against the company was drawn upon the theory that the lightning first struck the telephone wire, which it followed to the point where it melted the wire, causing it to drop down upon the barbed wire and allow the current to pass along the fence wire down to the point beyond which the man was killed. For weeks after the accident occurred the farmers of the neighborhood in discussing the accident argued that when the current was on the telephone wire it became heated, melted and severed and dropped down, heavily charged, upon the barbed wire, and was, therefore, the proximate cause of the death. The attorney who drew the complaint and the farmers that discussed the case seemed to have overlooked the fact that the stroke of lightning was instantaneous and that no power on earth could determine where the current first struck or that the erection of the telephone lines was the proximate cause of the injury.

It is only by unusual vigilance, care, caution and thoughtfulness that the telephone lines can be so constructed and maintained as to reduce the responsibility for personal injuries to a minimum, but, however careful and cautious a company may be, there is always the likelihood of a serious accident resulting from some oversight or neglect upon the part of the company for which it would be legally liable.

GENERAL TELEPHONE NEWS.

The South Side Telephone Company of Hampton-Sidney, Va., has extended its lines to Crewe, Va.

H. T. Holverson has resigned as president and secretary of the Interurban Telephone Exchange Company of Alexandria, Minn.

The Home Telephone and Telegraph Company intends to apply to the trustees of Fresno, Cal., for a telephone franchise. If granted, the company will immediately begin the construction of the new system.

Plans for extensions that will cost $300,000 and which are the first move in building lines that will practically cover the entire Puget Sound country have been perfected by the Independent Telephone Company of Seattle, Wash.

C. E. Sumner of Toledo, Ohio, has applied for a franchise for an Independent telephone system at Spokane, Wash. He agrees to spend $300,000 in Spokane within three years if a franchise is granted him. The proposition will be opposed by the Sunset Telephone Company.

It is expected that at an early date the government will complete the telephone line between Phoenix and Livingstone, Ariz., at the upper end of the Tonto storage basin. The poles have been on the ground for some time, although it is understood that the contract for construction has not yet been let.

John C. Johnson, secretary of the Delaware and Madison County Telephone Company, died at Muncie, Ind., last week. He was highly esteemed in Muncie and as a token of regard all business in the city was suspended during his funeral and for a short period all factories and street cars ceased operation.

The annual convention of the Independent Telephone Association of Wisconsin will be held in Milwaukee on January 25th and 26th. Headquarters will be at the Hotel Pfister. The officers of the association are: President, Richard Valentine of Janesville; vice-president, H. G. Slater of Waupaca; secretary and treasurer, H. C. Winter of Madison.

The Western Electric Company has a force of 10 men at work installing the new switchboard for the Missouri and Kansas Telephone Company at Wichita, Kan. The board is of the latest model central-energy type, with a capacity of 5,000. The total cost will exceed $50,000. The entire finish of the board is of mahogany. G. H. Keep, electrician in charge of the work, thinks that the new board will be in operation in about 60 days.

The city of Chicago has begun a suit in the Circuit Court to force the Chicago Telephone Company to produce its books for inspection, in an effort to secure an accounting. The city bases its demand for an accounting on its agreement with the company that three per cent. of the company's gross receipts should be paid the city for the franchise rights given the company. The dispute is over the receipts in the territories annexed to Chicago since 1889, including the towns of Hyde Park, Cicero and Lake.

CORRESPONDENCE.

Great Britain.

London, December 10.—During the last two sessions of Parliament there have been one or two strenuous fights between tramway companies which have desired to obtain running powers over municipal tramways and the corporations which have been entirely opposed to such an idea. Two notable cases have been Newcastle this year and Birmingham last year, both instances being identical, viz., companies coming from outside districts and wishing to run inside the city. In the case of Birmingham the company lost its case, but came to an agreement, and in the case of Newcastle the corporation lost, and through running now takes place. Beyond what has taken place in Parliament, no statement has ever been issued as to the history of the movement concerning tramway-running powers, but a paper has just been read before one of the tramway associations which puts the whole matter in a very clear way. Strictly speaking the whole of the opposition of the local authorities has been due to a misguided policy that no direct means of tramway communication should be afforded its ratepayers outside their boundaries—at any rate by co-operation with outside authorities. This is exemplified by the circumstance that similar difficulties have arisen between two local authorities. The recent action of Parliament, however, would seem to have instilled a more broad-minded spirit into local authorities generally, for during the discussion on the paper above mentioned a proposal that a tribunal should be established to decide all cases where the question of running powers has arisen was welcomed by a number of municipal delegates. As a matter of fact this is merely a common-sense view of the whole difficulty, and it is not inconceivable that some at least of the local authorities must now realize that their attitude in the past has partaken of the childish.

An addition has just been made to the large number of places of amusement in London where electric power is used extensively in connection with the stage scenic apparatus. The London Coliseum, which will be opened in a day or two, is particularly well equipped, there being a number of motors for working, among other things, a stage, which is built in three concentric revolving rings. The scenery itself will be hoisted by winches worked electrically, and on the switchboard there are nearly 100 switches. The Coliseum will give a different class of entertainment from any house at present in existence over here.

In connection with the waterpower scheme of electric-power transmission in the North of Wales a large mileage of electric tramways is to be constructed amid the beautiful passes and valleys of the mountainous district around Snowdon. From one point of view this would certainly open up some of the most beautiful scenery in Great Britain to thousands who at present find themselves unable to undertake the necessary walking. On the other hand, the ordinary seekers after the beautiful are quite convinced that a sacrilege would be committed were such unsightly things as tram cars and trolleys to be allowed to penetrate such sacred districts. Hence quite an outcry is being raised against permitting these electric tramways to be built, although I fear it will avail little, seeing that a large portion of the necessary parliamentary powers have already been obtained.

With the increasing competition of electric tramways with the local traffic of many of the railways the idea of utilizing single-motor coaches for the latter and thus creating a much more accelerated service is largely being put into force by many railway companies. The Northeastern railway, in addition to its electrified lines at Newcastle, is running single petrol-electric coaches upon other less populous lines, but a rather poor efficiency, from the engineering point of view, is said to be obtained from this combination. Consequently the Great Northern Railway Company has reverted to the petrol engine alone for such work, and an improved coach fitted in this manner is now running upon certain urban lines about 30 miles from London.

The troubles of the London County Council in regard to the conversion of the North London tramways to electric traction would not appear to be diminishing. Last week one of the borough councils which have a veto in the matter resolved by a majority of 20 not to entertain any scheme which entailed the use of overhead wires. The council wished to adopt the overhead system and had hopes of converting the borough councils to this view.

A bill will be introduced this session by the London County Council to enable the London borough councils to undertake the wiring of consumers' premises for electric light. Two years ago a similar proposal was defeated by the London electrical contractors on the ground that it would cut into their business in an unfair manner, and the only compromise they are willing to come to is that the work authorized under the above bill shall be given out to contract. Unless the council gives way in this matter it will find itself involved in a heavy expense to fight the opposition.

G.

New York.

New York, December 17.—A flood tied up the trains in the subway on Wednesday morning through the bursting of a 36-inch water main 100 yards north of the uptown subway station at Eighty-sixth Street.

The Lambert Schmidt Telephone Manufacturing Company of Weehawken, N. J., has furnished a number of telephones which have been installed on the platforms of the subway stations. These telephones are connected with the Interborough company's central switchboard and are available for the use of employes and such of the general public as have need of official information.

Subway Contractor J. B. McDonald, according to expectation, has become associated as a director with the Metropolitan Securities Company. This means that he will be interested in a projected East Side subway in rivalry of that of the Interborough company. Mr. McDonald states that the West Side tunnel which he constructed has not solved the problem of rapid transit, and he foreshadows an independent East Side subway to be built by the Metropolitan Street Railway Company. Mr. McDonald has also become identified with the Port Chester Railway Construction Company, which hopes to have its cars running into New York in two years time. This company was organized this week with a capital of $1,500,000, paid up.

The old "Steinway" tunnel, which was begun in 1890 by Messrs. Steinway, the piano manufacturers, who built the trolley-railroad system of Long Island City, and was blocked through damage cases resulting out of a fatal explosion of dynamite, is now to be taken up and completed by the Interborough Tunnel Company, of which August Belmont is the head.

The Supreme Court, at the instance of William R. Hearst, has granted an injunction restraining the city paying any money to the lighting companies under recent contracts. This means that the companies will have to sue the city for their money and produce evidence on the subject of actual costs. The friends of the Consolidated Gas Company spoke out on Tuesday last in the controversy over the cost of lighting and declared that the company would be obliged to keep up its prices to offset the special franchise taxes of more than $600,000 a year. Mayor McClellan has veered around to a qualified approval of establishing a municipal-lighting plant. There is a plan under way on the part of the capitalists of the Interborough Construction Company to supply the city with cheap light at $90 per arc light. This would mean a reduction of $750,000 a year in the city budget. This company through its big power house at Fifty-ninth Street and also through its control of the subway and elevated lines could install a system of electric-lighting wires on short notice.

Electricity will probably replace steam in all the suburban belt of the New York Central during next year. The plans include the building of a new underground station about 20 feet below the surface of the street for connections with the rapid-transit subway, and the proposed Belmont tunnel under East Forty-second Street to Long Island City, where a connection will also be made with the New York and Queens County Railroad system.

The Manhattan and Bronx Electric Company of New York has been incorporated at Albany. Its capital is $10,000 and the directors are Willis B. Richards, New Rochelle; John S. Clark and James C. Stafford, both of Brooklyn.

There were a few electrical novelties at the Business Exhibition at Madison Square Garden this week. A new model of the Universal adding machine was shown, operated by a 1-20 horsepower motor. A similar motor was attached to a "comptograph." The De Veau Telephone Manufacturing Company of 27 Rose Street, New York, showed several forms of automatic telephones, and the Oliver Manufacturing Company of Philadelphia showed its Equipoise telephone-holder, attachable to desks in awkward places. The Equipoise is used in the post-office at Washington, D. C. There were also some speed contests for telegraphers and a practical demonstration of the typewriting telegraph. Among the telegraphers who entered for the contests were W. M. Gileson, J. P. Gallagher, C. P. West and Miss K. Stetson, all of the Postal company, and Miss Marmion of the Western Union. Andrew Carnegie has offered a gold medal for next year's contests.

D. W. W.

New England.

Boston, December 17.—The Western Massachusetts Street Railway Company, which sought special privileges and a special charter at the last session of the state Legislature, has taken out a charter this week under the general laws relating to street-railway incorporation, and is capitalized for $300,000. It will be 40 miles long, running from Westfield to Lee.

In spite of strenuous objections by the Boston and Maine railroad and the Boston and Northern Street Railway Company, whose lines will be paralleled to a considerable extent by the proposed new Boston to Haverhill trolley company, which has been seeking permission to enter the field, the Massachusetts railroad commissioners have approved the project and intimate their readiness to authorize the building of the road when certain necessary conditions have been complied with.

The Lowell and Boston Street Railway Company will be sold at auction on December 21st at Woburn, subject to a mortgage of $250,000 held by the Federal Trust Company of Boston. The road has been in receivers' hands for a number of months.

Hon. William E. Barrett, the largest stockholder in the Templeton Street Railway Company, purchased the road on Saturday last at a foreclosure sale for $100,000.

The American Loan and Trust Company, holder of $200,000 bonds of the Hampshire and Worcester Street Railway Company, for which a receiver was sought a short time ago by William E. Swindell and others, has filed a petition to intervene and for leave to file a bill of foreclosure of a mortgage made by the company to the complainant as trustee. The case comes up the first Monday in January.

The annual report of the Massachusetts Electric Companies says that weather conditions in the last year were the most trying and unsatisfactory known since street railways have played any considerable part in the transportation of the public. The consolidated income account for the year ended September 30th shows: Gross earnings, $6,380,863; operating expenses, $4,479,520; interest, rent and taxes, $1,462,626; dividends, $466,003; deficit, $27,286. The president, in his report, said that the new turbine power house at Newport was working satisfactorily.

Telegraphers in the employment of the Boston and Maine Railroad Company have been granted an increase in wages, and more satisfactory working conditions at an increase of about $37,000 in the railroad's annual expenses.

A great scramble to secure additional street-railway franchises will take place before the next session of the General Assembly of Connecticut. Established trolley corporations will apply for extended privileges, and new enterprises which will seek incorporation and charters are springing up in all sections of the state.

The bill in equity brought in January, 1903, by Charles G. Kidd of Kirriemuir, Scotland, and G. Henry Whitcomb of Worcester against the New Hampshire Traction Company, New York Security and Trust Company, the Massachusetts Trust Company of Connecticut and Wallace D. Lovell, came on for trial before Judge Peaslee on Monday last. The plaintiffs claim that they were creditors of the Massachusetts Construction Company of Connecticut and Mr. Lovell to the amount of $244,000.

Southeastern States.

Charlotte, N. C., December 17.—It is reported that investigations have been made by a syndicate of New York banking houses of the franchises and charters of the United Railways and Electric Company at Baltimore, Md., and that if the property in Baltimore is secured several million dollars may be spent in improving the system.

The county commissioners have granted the franchise asked by the Raleigh and Durham (N. C.) Traction Company. The Raleigh Chamber of Commerce has also endorsed the proposition to build this 28-mile electric line.

J. B. McClary, who recently resigned the management of the railway department of the Birmingham (Ala.) Railway, Light and Power Company, has accepted the position of general manager of the company at Sheffield, including the public utilities of that town, and Tuscumbia and Florence.

It is given out that the directors of the Baltimore, Sparrows Point and Chesapeake Railway Company and the executive committee of the United Railways and Electric Company have ratified the sale of $1,700,000 4½-per cent. bonds of the Sparrows Point company to the banking firm of Dominick & Dominick of New York and a syndicate formed by J. William Middendorf of Baltimore. The bonds are part of a $2,000,000 issue and are a first lien on the property of the Sparrows Point company, the United Railways and Electric Company having leased the property for a long term.

The Murphy Electric Light and Power Company of Murphy, N. C., has been chartered with a paid-in capital of $6,000. The incorporators are A. J. Gentry, S. W. Lovingood, R. V. Swain and others.

The Hampton Roads (Va.) Railway and Electric Company has secured entrance into Old Point and the government reservation, and the first car was run on the new line recently.

George L. Upshur, representing the American Monorail Company, has made arrangements with the Richmond Electrical Company of Manchester, Va., for the building of the first motor for the line between Baltimore and Washington. The track between the cities named has been partly laid and the stockholders are said to entertain no doubts as to the feasibility of the plan for operating the road and that a five-minute service between Washington and Baltimore may be eventually secured by the monorail system.

L.

Ohio.

Cleveland, December 17.—An order to abolish through car lines has been presented to the Cleveland Board of Public Safety by the Cleveland Electric Railway Company. Under the present arrangement the tracks about the Square become congested morning and evening, and the plan is to break all lines at that point. The safety board seems to be unwilling to allow this change unless it is accompanied by a reduction in fare. As the cars now run a passenger may go almost any place for one fare, including a transfer. The argument is now made that where passengers ride only to the Square a reduction should be made, but if they take a

transfer entitling them to complete their trips on other lines, then the full fare may be charged.

In October the Toledo and Western handled 497 standard freight cars, in comparison with 315 in October, 1903. This indicates a handsome growth in the freight business of the road.

Arrangements between the Dayton and Western and the Indianapolis and Eastern have been made for a through-car service between Dayton and Indianapolis. It has been possible for some time to make the trip by changing cars at Richmond.

Last Wednesday a party of Indianapolis business men visited Cincinnati and other Ohio cities on an inspection trip, with a view to gaining information on the advisability of adopting an interchangeable mileage book, to be used in connection with the Ohio association roads. It is possible that the Ohio Interurban Association may develop into something like the Central Passenger Association so far as that phase of the business is concened. The visitors were entertained at lunch at the Queen City Club by President Kelsey Schoepf of the Cincinnati Traction Company.

While the report has not been substantiated, it is said the Lake Shore Electric Railway Company will shortly apply for membership in the Central Passenger Association. This will bring about a decision on the part of the steam roads as to whether they will affiliate in any way with the electric lines. The Lake Shore Electric had a working arrangement with the Clover Leaf on St. Louis fair business for a time. It also has a special arrangement with the Baltimore and Ohio on the Sandusky division. Attempts to arrange with the Wheeling and Lake Erie, Pennsylvania and some other lines failed.

In connection with the proposed through-car service between Cleveland and Detroit, to be inaugurated by the Lake Shore, it is said that sleeping cars have also been considered, but it has been found that a sleeper would not pass through a number of bridges and that the tracks are so close together in Cleveland and Toledo that it could not pass other cars by about five inches. It is believed that sleepers on most trolley roads are impractical at present for that reason, but it is evident that the road must be rearranged to accommodate them at some time.

The lighting committee of the Toledo City Council has recommended the ordinance granting the East Side Heating and Lighting Company a franchise to operate over a territory covering about half of the East Side. The company agrees to build a plant costing not less than $50,000, and heat and light all the city buildings in that section.

A special committee of the City Council of Youngstown has decided to recommend the issue of $100,000 bonds for the purpose of building an electric-light plant. O. M. C.

Indiana.

Indianapolis, December 17.—The Indianapolis and Northwestern Traction Company carried 971,000 people during the first year of operation, an average of 2,600 a day. This is 16 times the tributary population of the cities, towns, villages and rural districts for three miles on each side of the right-of-way outside of Indianapolis.

Experiments of importance in the solution of electric-railway problems are to be conducted during the next few months in Anderson and on the lines of the Indiana Union Traction Company. They will be the final work of the electric-railway test commission of the Louisiana Purchase Exposition. Next week a car of interesting equipment will be run over the lines of the road to make the records in the series of experiments. The experts in charge will ascertain the elements and effects of resistance, principally from air, when the car is at high speed. A flat car to carry the interurban car, built of steel expressly for this test, will be mounted upon Baldwin trucks equipped with four motors of 300-horsepower capacity. Upon the flat car will be placed the body of an interurban car mounted upon four pairs of small wheels carried in ball bearings, the wheels rolling upon rails spiked to the flat car. When the commission completes its experiments on the Indiana Union Traction lines it will be able to state accurately the effect of all pressure or resistance that an interurban electric car encounters when at full speed. There will be a report also on tests of motors, gearing and other apparatus. "The work to be done is the most important part of the task laid out by the commission, and for it much preparation has been made," said Prof. H. H. Norris of Cornell University. A radical plan has been devised for measuring directly the several components of car resistance. This plan was approved by all the engineers who have been consulted in regard to it, and all agree that the investigation is by all means the most important to which the commission can devote its efforts. The work is under the direction of Professor Goldsborough of Purdue University, who was chief of the electrical department at the exposition and chairman of the executive committee of the Electric Railway Test Commission. Professor Norris of Cornell and Professor Swensen of the University of Wisconsin are here to superintend the test. Electric students and interurban railway men are also interested in witnessing the tests. The cost of the experiments or tests is being shared jointly by the large electric lines of the country.

Indiana electric-railway men are greatly elated over a recent decision of the New York Court of Appeals holding that the steam roads may not refuse to deliver loaded freight cars to the electric lines. This case is identical with the Big Four-Plainfield case, and it is confidently expected that the Indiana courts will make an equally favorable ruling. The incident, however, has created a demand for legislation and a bill is now being prepared.

The first hearing on the petition of the Indianapolis, Newcastle and Toledo Traction Company for an independent entrance to Indianapolis was heard this week. The Terminal company opposes the petition and the fight promises to be strenuous.

The promoters of the Geneva Traction Company report that their line to be constructed between Marion, Ind., and Celma, Ohio, has been financed and work will begin in the spring. The line will traverse a rich part of the country and through the heart of the oil belt. The estimated cost is $2,000,000.

A representative party of Indianapolis business, professional and interurban men made a most notable and extensive tour of Indiana and Ohio electric lines during this week ever attempted before. The men were guests of the Indianapolis and Eastern Electric Railway Company and car No. 15, in charge of J. W. Chipman, general manager, carried the party over nearly 800 miles of electric road. The possibilities of interurban travel from Indianapolis eastward were demonstrated so thoroughly that already arrangements are being made for through service, interchangeable tickets and traffic agreements. While the party was in Ohio the Richmond Interurban Company lowered the grade under the low railroad bridge in Richmond so as to permit the Indiana interurban cars to pass under without trouble, and thus a contention of a year's standing was removed in a few hours' time and at small cost. There will eventually be through service from Indianapolis to Columbus and Zanesville, Ohio. S. S.

Michigan.

Detroit, December 17.—It is authoritatively stated that there is no truth to the story that the Michigan Central Railroad Company contemplates the purchase of the Jackson-Battle Creek electric line.

The Lansing Business Men's Association will hold a meeting for the purpose of securing aid to the project of building an electric line to Pine Lake, a resort about nine miles distant from the city. The Lansing and Suburban Traction Company wants $10,000 for completing the project. A line has been in operation to the Michigan Agricultural College grounds for several years, three miles in length, and it is proposed to make the extension from the college grounds

Electrical Workers Local Union No. 133 gave its second annual ball and electrical display in Strassburg's Academy on Wednesday evening. The hall was beautifully illuminated, 2,500 electric lights being used for the purpose.

Alderman Max C. Koch will ask the corporation counsel for an opinion relative to the power of the Common Council to regulate the rates of the Edison Illuminating Company. A citizen maintains that the present system of rates as charged by the company for illuminating purposes is unjust.

Theron W. Atwood, commissioner of railroads of Michigan during the last two years of Gov. Bliss' administration, has been reappointed by Governor-elect Warner. Commissioner Atwood has jurisdiction in the state over electric lines in certain cases.

The line of campaign to be followed by the Detroit United when its franchises on the principal streets of Detroit begin to expire is suggested in a circular issued for the sale of $8,200,000 worth of the company's bonds, which is accompanied by a letter signed by President Hutchins. The company holds long-term franchises on parts of its lines, granted by township boards before these parts of the city were annexed and which were sustained by the courts. With these stub-end franchises to use as a club on the city, the company may force the community to give it an extension of its rights on downtown thoroughfares. President Hutchins calls attention to the fact that the company charges only one fare on Jefferson Avenue for a trip covering three different franchises, on which it could charge three fares, if it cared to insist upon its legal rights.

The Detroit, Monroe and Toledo Short Line may soon announce direct electric service to Cleveland. A special car carrying officers of the road made the trip Thursday. Vice-president C. A. Black says: "Our road has lost some business through passengers having to change at Toledo. If we find the through service practicable, we shall make some traffic arrangement with the Everett and Moore people, who operate the line between Cleveland and Toledo." The actual running time between the two cities, including all stops except Toledo, was six hours. The run from Cleveland to Toledo took four hours and from the Boody House in Toledo to the Russell House in Detroit two hours. As soon as the details can be worked out, the company will inaugurate a through service between Detroit and Cleveland with the schedule time between the center of the two cities placed at seven hours. C. G. W.

Northwestern States.

Minneapolis, December 17.—A new independent light and power company will ask for a franchise at La Crosse, Wis. It will be capitalized at $200,000. A vigorous fight will be made against granting such a franchise, it is said.

The Interurban Railway Company of Des Moines, Iowa, proposes to build a line from that city to Eldora.

The Cascade Milling Company of Sioux Falls, S. D., will replace the six dynamos in its electric plant with one large generator, which will mean a doubling of the plant's capacity.

The Apple River Power Company has suspended work for the winter on its new power plant at Somerset, Wis., from which electric power is to be brought to Stillwater, Minn. The dam and buildings are practically completed and the machinery will be installed early in the spring.

A new electric-light franchise is being considered by the council at Aberdeen, S. D. It is said to be the most favorable to the city of any franchise in the Northwest.

Preliminary surveys have been made for a trolley line from the Twin Cities to Faribault, Minn., a distance of about 65 miles. If built, the new line will connect with the Twin City Rapid Transit Company's lines.

The new electric-light plant at West Point, Iowa, has been completed and the plant is now in operation.

It is reported that a branch interurban line will be built from Sioux City, Iowa, to Audubon, where it will connect with the new line to be built from Des Moines to Council Bluffs.

George Horn has sold his electric-lighting plant at Cavalier, N. D., to James Lang.

A contract has been granted at Fairfield, Iowa, for a new electric-light plant.

A new electric-light plant is being installed at Withee, Wis. It is owned by Robert Hemphill of Neillsville. R.

Pacific Slope.

San Francisco, December 16.—The Current Power Company has been incorporated at Seattle, Wash., with a capital stock of $2,000,000. The incorporators are Edgar Courtwright, W. H. Boothroyd, Guy C. Hamilton, W. Harry Boothroyd of Tacoma, Wash., J. D. Hanbury, J. R. Carman and Phillip Wheeler of Seattle. Seattle is the principal place of business.

The La Grande Electric Light Company and the Cove Power Company of La Grande, Ore., have consolidated and incorporated under the name of the Grande Ronde Electric Company. The directors are Walter Pierce, J. A. Thronson, T. H. Crawford, Clarence Crawford and T. R. Berry of Union, Ore.

The Electric Supply Company has been incorporated at Sacramento, Cal., by Joseph C. Hobrecht, C. V. Schneider, H. G. May and others. The capital stock is $10,000. The company is formed to take over and purchase the business of which C. V. Schneider is the owner.

J. F. Parkinson, president of a corporation composed chiefly of eastern capitalists, has closed negotiations with the Santa Clara and San Jose Railway Company at San Jose, Cal., for the purchase of the Santa Clara and San Jose, Alum Rock Park and tributary lines. It is the intention to build a trunk line from San Mateo to Redwood City, thence to Palo Alto, thence to Mayfield, Mountain View, Sunnyvale, Santa Clara, San Jose and Gilroy.

It is reported that the Southern Pacific Railroad Company may install an electric plant at Dunsmuir, Cal.

The Washington Water Power Company is planning on the construction of a branch electric line to Silver Lake, in connection with the Medical Lake system. In addition to the Silver Lake branch, the company has applied for a franchise through Medical Lake, Wash., to the western city limits. It is expected that the Medical Lake line will be ready for cars by the first of June.

The Pacific Electric Railway Company will expend about $2,000,000 in a direct line to Covina from Los Angeles, Cal.

A representative of T. H. Warford and William Redaker of Ballard, Wash., has asked the council of Sumas, Wash., for a franchise to operate an electric-light plant in the town of Sumas for a period of 50 years.

H. E. Huntington has purchased the controlling interested in the Pacific Electric and the Los Angeles Interurban Railway Company at Los Angeles, Cal.

The Consolidated Heat, Light and Power Company has been incorporated at San Francisco by William Thomas, Mark L. Gerstle, Robert N. Frick and others. The capital stock is $300,000.

The electric power plant of the Eureka Lighting Company at Eureka, Cal., was destroyed by fire on December 13th. Five dynamos and other machinery were destroyed. The loss is $30,000, with insurance at $17,000.

Warren Gillespie has applied to the council of Los Angeles, Cal., for a franchise for an electric street railway commencing at the intersection of Wilshire Boulevard and Commonwealth Avenue, Los Angeles.

Preliminary surveys for the Salem-Liberty-Rosedale electric line have been commenced by Surveyor Herrick. Mayor F. W. Waters of Salem, Ore., who is at the head of the new company, states that the road will be built if proper assistance can be secured from the people.

The restraining order preventing the adoption and publication of an ordinance granting L. U. Brewer

an electric-light franchise at Seattle, Wash., has been dissolved. Mr. Brewer has been given 30 days to accept the franchise and agrees to pay $1,000 for the privilege of operating a lighting system in Seattle, guaranteeing to have 2,500 16-candlepower lights ready for use inside of six months. He will probably turn the franchise over to the Seattle Electric Company, which will run a service line from its plant.

J. McDowell of Deer Park, Wash., has made application for a franchise to establish and operate an electric-light plant in Reardan, Wash. The ordinance before the council will no doubt be finally passed at the January meeting. The plant will probably be in operation by March 1st. A.

PERSONAL.

August Belmont succeeds the late Senator Hanna as president of the National Civic Federation. His election occurred on December 15th, and the fact was announced by H. H. Vreeland.

John T. Nyhan, formerly superintendent of the Macon (Ga.) Railway and Light Company, has been appointed general manager by the board of directors to succeed J. H. Hertz, who has been compelled to retire on account of poor health.

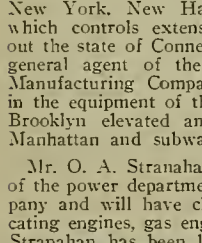
Friends of Mr. T. C. Penington, secretary of the American Street Railway Association, will deeply sympathize with him in the loss of his son, Mr. Charles R. Penington, who died in Arizona on November 30th. The decedent was the paymaster and cashier of the Chicago City Railway Company, by which he had been employed for more than 20 years. He leaves a widow and two children.

C. C. Lewis, who for the last two years has occupied the position of chief engineer of the Schenectady Railway Company, will sever his connection with that company on January 1, 1905, when he will sail for London to enter the employment of J. G. White & Co. Mr. Lewis has been engaged principally to take charge of the work to be carried out by the company at Montevideo, Uraguay, in electrifying the street railways at that place. He has had an extended experience of over 15 years in railway work.

William R. Chapman, the new manager of the Western Union Telegraph Company at St. Paul, Minn., is a native of Canada, having been born in Brighton, Ont., in June, 1864. He commenced telegraphing in Canada in 1879 and held many positions before going to Buffalo, N. Y. In 1883 he came to Illinois and was engaged with the Western Union at Jacksonville and Chicago. Later he became manager for the company at La Crosse, Wis., holding the position for 19 years, until he was promoted to the St. Paul office.

Calvert Townley has received the appointment of assistant to President Charles S. Mellen of the Consolidated Railway Company, closely allied with the New York, New Haven and Hartford railroad, which controls extensive trolley interests throughout the state of Connecticut. Mr. Townley has been general agent of the Westinghouse Electric and Manufacturing Company at New York and helped in the equipment of the Boston elevated system, the Brooklyn elevated and surface systems, and the Manhattan and subway systems of New York city.

Mr. O. A. Stranahan has been appointed manager of the power department of the Allis-Chalmers Company and will have charge of the sales of reciprocating engines, gas engines and steam turbines. Mr. Stranahan has been lately in charge of the engine business of the British Westinghouse Electric and Manufacturing Company, and in that work has met with marked success. He has given much attention to gas-engine developments. He graduated from Cornell in 1890, and immediately entered the service of Westinghouse, Church, Kerr & Co., working up through their various departments, and becoming chief engineer of their Chicago office. When the British Westinghouse Company was formed Mr. Stranahan was appointed to the charge of its engine business. He began these duties in 1900. Mr. Stranahan has not only a wide business acquaintance throughout the United States, but his work abroad has given him an extensive European connection. His new appointment dates from December 1st. He arrived in New York, from England, about the middle of December, and proceeded at once to Milwaukee, where he will establish his headquarters.



O. A. STRANAHAN.

Mr. W. J. Sando, whose high reputation as a pumping-machinery expert has been for some years the subject of favorable comment, is one of the important recent additions to the strong organization of the Allis-Chalmers Company. Mr. Sando has been appointed manager of the company's pumping-machinery department, with headquarters in Milwaukee. Although still a young man, he had filled many responsible places, both in private and public employment, before joining the Allis-Chalmers forces. His last public service was with the New York City Commission on Additional Water Supply, with which

W. J. SANDO.

he served from May 1, 1903, to January 1, 1904, as engineer in charge of the pumping department. Mr. Sando is one of those who have risen to high rank through the practical school rather than the academic. He was born in Scranton, Pa., in 1864. He took the public-school course, and then served an apprenticeship of five years as a machinist in the works of the Dickson Manufacturing Company at Scranton. He followed that with another apprenticeship of two years in the drafting room. Thus equipped he became in 1886 draftsman and inspector of pumping machinery for E. D. Leavitt, M. E., and then was fairly launched on a successful career.

ELECTRIC LIGHTING.

An electric-light plant will soon be constructed in the city of England, Ark., by the city.

The Humble Electric Company of Humble, Tex., has been incorporated with a capital stock of $30,000.

The Montpelier (Idaho) Electric Light Company has increased its capital stock from $25,000 to $40,000.

The erection of an electric-light plant at Lexington, S. C., is contemplated by S. B. George and J. E. Kaufman.

J. K. Nance of Ada, I. T., has purchased the light plant of the Jacksonville Electric Company at Jacksonville, Tex.

G. L. Hawkins and associates have secured the franchise to erect and operate the proposed electric-light plant in Hattiesburg, Miss.

It is reported that Jacob Schiff and associates of New York are trying to get a franchise for an electric-light and gas system in San Francisco.

The city of Wiggins, Miss., has granted a franchise to the Wiggins Electric Light and Power Company to construct and operate an electric-light plant.

The citizens of Chillicothe, Mo., have decided to have the electric lights turned off in the city streets rather than pay an advance of $7 per light on the present cost.

A combined electric-light and cold-storage plant will be operated in Russellville, Ark., by A. Bernard, R. L. Harkey, W. T. Meek and associates, who have incorporated as the Merchants' Light and Cold Storage Company.

The auxiliary electric-light and power plant which the Utah County Light and Power Company of American Fork, Utah, is arranging to install 1½ miles above its present plant in the American Fork Canyon, will, it is estimated, cost about $150,000. The survey is completed.

Bids will be received by the city of Anadarko, Okla., up to and including January 2, 1905, for a complete electric-lighting plant consisting of a 150-kilowatt generator, 200-horsepower engine, necessary pole line, transformers, arc lights, etc. Information may be had of W. S. Sherman, consulting engineer, Anadarko.

Max Hart, a postoffice clerk in New York city, a few days ago bought a trunk at a storage warehouse for $4. Tucked in one of the corners, it is said, he found bonds of the Southern Electric Lighting and Water Company which have a market value of between $17,500 and $20,000. The accrued interest at six per cent., which has not been collected for years, adds nearly $10,000 to the value of his find. Hart submitted the bonds to the inspection of officials of the Twelfth Ward Bank and then in turn to a broker, who established their value beyond question, it is said.

ELECTRIC RAILWAYS.

For the construction of an electric railroad 60 miles long from Depew to Rochester, N. Y., the Buffalo and Rochester railway of Depew, Erie county, has been incorporated. The capital is $3,000,000, and the directors are H. H. Kingston, J. Andrews Harris, Jr., of Philadelphia, and H. P. Bissell of Buffalo.

It is said that the Lake Erie steamer companies are looking with considerable anxiety at the inroads the trolley lines are making on their freight and passenger business. The roads will soon have arrangements for through service between Cleveland and Detroit, and this will undoubtedly hurt the package-freight as well as the passenger business the boats have been having.

The plaintiffs in the suit against Brown Bros. & Co. to set aside the absorption of the Transit company by the United Railways of St. Louis, have petitioned the United States Circuit Court to remand the case back to the St. Louis Circuit Court. The suit, together with injunction proceedings, was brought in the state court shortly after the announcement of the street-railway deal. James Brown, who was named as one of the defendants, secured its removal to the Federal Court on the ground that he was a non-resident.

According to a recent opinion of Attorney-general H. J. Hamlin of Illinois, street-railway crossings as well as those of steam roads are under the control of the state railway and warehouse commission. The significance of this interpretation of the law is found in the fact that the railroad and warehouse commission issued notice a few months ago that no more grade crossings would be allowed to be constructed in the state and that all such crossings now in existence must be guarded by interlocking devices.

A company has been formed at Dunfermline, Scotland, to build an electric railway through the west of Fifeshire. The promoters have given notice to the Fife County Council and the corporations of Dunfermline, Inverkeithing, Cowdenbeath and Lochgelly of their intention, and it is expected the company will begin the construction of the road in the spring of 1905. The road will be 16 miles in length, and besides connecting the towns mentioned will ultimately touch the new naval base on the Firth of Forth. The estimated initial cost is $632,645. The Fife Electric Power Company, which is now building a power plant at Dunfermline, will supply the power required for all purposes in the operation of the tramway system when completed.

SOCIETIES AND SCHOOLS.

The American Association for the Advancement of Science will hold its fifth annual meeting in the buildings of the University of Pennsylvania, Philadelphia, on December 27th to 31st. Several affiliated societies will meet at the same time.

The technical and art school plays an important part in the commercial and artistic education of the young people of Leicester, England. It is a municipal institution, founded about seven years ago, to give a thoroughly modern and scientific training in the more important manufacturing processes and industries carried on in Leicester, and also for the encouragement of artistic pursuits. The curriculum includes among its subjects chemistry, physics, electric lighting, power distribution, mathematics, etc. The technical side of the school has 1,500 students, and its workshops are fitted with modern machinery, tools and appliances, lecture rooms, laboratories, library, reading room, etc.

PUBLICATIONS.

A mailing card calling attention to Wagner transformers and the new type of vertical single-phase motor described elsewhere in this issue is being sent out by the Wagner Electric Manufacturing Company of St. Louis.

A long-established firm dealing in mica is that of Eugene Munsell & Co. of New York and Chicago. Mica for insulation is one of its specialties and consequently it has issued a standard price list on "Electrical Mica" which those interested in mica will do well to look over.

The Ashton Valve Company of Boston has issued a handsome wall calendar for 1905. A picture in colors represents an attractive young woman in a rustic scene. The invitation beneath is "Meet me at the bars." The Chicago branch of the Ashton company is at 160 Lake Street.

An illustrated catalogue of electrical novelties has been issued by the Ohio Electric Works of Cleveland, Ohio. The catalogue, though small, lists a great number of small electric devices of a useful character, such as pocket battery lamps, igniters for gas engines, hand dynamos, induction coils, electric bell outfits, etc.

A "flyer" from the Crocker-Wheeler Company of Ampere, N. J., introduces a new line of variable-speed motors being manufactured by that company. The new motors range from two to 25 or two to 32 horsepower, according to the voltages, which are 115 and 230 volts, respectively, that is, for a 2 to 1 speed range. For a 3 to 1 speed range the sizes are from 1½ to 20 horsepower.

The Citizens' Alliance of Joliet, Ill., has published a handsome booklet of 24 pages, with map and half-tone illustrations, in which are pointed out some of the advantages of that city as a residence and manufacturing center. One of the advantages set forth is the economical and reliable waterpower made possible by the development of the large volume of water from the Chicago Drainage Canal.

Anyone desiring to inform himself thoroughly concerning Bullock rotary converters will do well to obtain bulletin No. 103t from the Bullock Electric and Manufacturing Company of Cincinnati. This bulletin is carefully prepared and handsomely illustrated. Each part of the apparatus comes in for a detailed description and there are a number of interior views illustrating typical installations of Bullock machines.

With characteristic promptness, Secretary T. C. Penington of the American Street Railway Association has his report already printed for the meeting held in St. Louis last October. Besides a list of the officers of the association and the papers presented at the convention, the report contains lists of the members of the association and of representatives of manufacturers and the ladies in attendance

at the convention. All the past-officers are also given since the organization of the association. The present officers are: President, W. Caryl Ely of Buffalo; first vice-president, Elwin C. Foster of New Orleans; second vice-president, John I. Beggs of Milwaukee; third vice-president, Richard McCulloch of St. Louis.

The new edition of the National Electric Light Association's report of rates for commercial lighting and power service has been published. This, the second edition, is about one-third larger than last year's book and contains returns from 750 cities and towns. The first edition, issue in November, 1903, met with general demand, and the present book, revised and larger, will be of great value to members of the association, for whom it is issued.

The Helios Manufacturing Company of Bridesburg, Philadelphia, Pa., American manufacturer of the Bastian electrolytic meter for direct-current work, has issued a new bulletin on this type of apparatus. Some of the advantages claimed for this meter are that there are no wheels, coils, commutators, jewels, permanent magnets or the like to get out of order; extreme simplicity; it cannot be tampered with by unauthorized persons, and is unaffected by heavy excess current or short-circuits.

Not only is the new booklet of the Westinghouse Machine Company upon mechanical stokers neat and pretty to look at, but it also contains information of a useful character concerning the construction and operation of the Roney stoker. About one-half of the booklet is given up to a description of this particular style of stoker, which is followed by numerous illustrations of actual installations. The installations pictured are the finest and most interesting of their kind, and they make an extremely good showing, as the engraving work is of the highest order. As illustrative of the most modern ideas in catalogue work the booklet under consideration may be taken as one of the best examples.

The annual report for 1903 of the Board of Rapid Transit Commissioners for New York city has been issued in the form of a large volume of 300 pages, with many illustrations and maps. The most interesting portion of the report is that dealing with plans for the future. The commissioners realize that when the present subway is completed great congestion of traffic will occur at certain points, and hence they have planned large subsidiary schemes. Various suggestions are made to deal with the traffic over the two existing bridges. A moving platform is also proposed for the Williamsburg Bridge. Full details are given, with photographs, of the construction and cost of the subway and of various lines still under construction. The report of Chief Engineer W. B. Parsons covers 115 pages and gives elaborate technical details of the contracts and subcontracts of the New York subway. The whole report is well worthy of close study by engineers interested in the problem of rapid transit in large American cities.

SPACE TELEGRAPHY.

Owing to interruption of the cable between Penzance and the Scilly Islands the Commercial Cable Company announced recently that service would be resumed by space telegraphy via Falmouth and the Lizard. At the headquarters of the company an official said that the cable in question was a short one owned by the British Postal Service and had no connection with transatlantic cables, none of which touch the Scilly Islands. The distance from Penzance to Scilly is short, but the cable is laid over a rocky bottom and is often out of order, and a wireless system is kept to fall back on. The Commercial official said that the wireless was now being used in connection with the cable in the Hawaiian Islands.

The interdepartmental board appointed by the president to consider the entire question of space telegraphy in the service of the national government has recommended that the Department of Commerce and Labor should have the duty of issuing licenses for space-telegraph marine stations in special cases, under such regulations as will prevent interference with stations necessary to the national defense. It has also recommended that all private stations in the interior of the country should be under the supervision of the Department of Commerce and Labor. To prevent the control of space telegraphy by monopolies or trusts, the board deems it essential that any legislation on this subject should place the supervision of it in the Department of Commerce and Labor.

TELEGRAPH.

During a dinner of the American Asiatic Association in New York city, at which Prince Fushimi was present, a message was cabled to the emperor of Japan and an answer received before the dinner was over.

As stated in the Journal Télégraphique, the Swiss budget for 1905 provides the sum of $44,712 for a telegraph and telephone cable in the Simplon tunnel. Switzerland and Italy are at present connected by two telegraph lines over Simplon Pass.

The quarterly report of the Western Union Telegraph Company states that the net revenues for the quarter ending December 31st, based upon nearly completed returns for October, partial returns for November, and estimating the business for December, will be about $2,000,000. Interest on the bonded debt will amount to $297,550, and $1,217,020 is required for a dividend of 1¼ per cent. on the capital stock issued. Deducting these two amounts leaves an estimated total surplus of $15,920,292.80. The executive committee recommends that a dividend of 1¼ per cent. on the capital stock be declared payable on and after January 16th next. The surplus on October 1st, last, was $15,434,862.80, which indicates that the increase for the quarter ending will be close to $485,430.

An appeal in the suit of Charles E. Schriver and George Rolla Schriver against the Western Union Telegraph Company has been filed in the United States Circuit Court of Appeals. The plaintiffs were awarded $10,800 damages at the trial in the Circuit Court for the eastern district of Iowa. The final decision is important as bearing on the liability of a telegraph company for accepting and transmitting a dispatch in the name of persons other than by whom it is sent. The action arose from a telegram purporting to have been sent by the Bank of Denison, Iowa, to the Commercial Bank at Britt, Iowa, in March, 1902. The telegram was a guaranty that the draft of E. S. Barnes would be honored. On the strength of it the Schrivers, who are cattlemen, sold Barnes eight carloads of cattle and took his draft. The message was delivered to the telegraph company over the telephone.

MISCELLANEOUS.

Dr. Milton Franklin announces that he has discovered a method of measuring X-rays in such a way as greatly to reduce the danger of accidents through them to operators and patients. Dr. Franklin points out that many of the injuries have been due to inability to measure the energy of the emanations from the tube. His method consists in measuring the ionization of the atmosphere by means of an electroscope of special design.

The streets of Munich, Germany, all of which are electrically lighted and cleanly kept, are well paved, about two-thirds with macadam and one-third with asphalt. The cost of maintenance in 1903 was $657,881 and the cost of cleaning $150,018. The electric street-railway lines have a length of 58½ miles; the number of motor cars is 288, and of trailers 281. The street-car lines are nominally in the hands of a private corporation, but in reality the city directs the operation and management and is also responsible for the financial undertakings.

The United States Civil Service Commission announces an examination on January 18-19, 1905, to secure eligibles from which to make certification to fill a vancancy of inspector of mechanical and electrical engineering (male) at $2,190 per annum, in the office of the supervising architect, Washington, D. C. Four subjects will be included, as follows: Mathematics, practical questions in mechanical and electrical engineering, drawing and design, training and experience. The respective weights given for these subjects are 10, 40, 20 and 30. Further information may be had upon application to the commission at Washington.

TRADE NEWS.

The Model Stoker Company has removed from Akron to Dayton, Ohio, where it should be addressed at the corner of Chapel and Kiser streets.

A. F. Hamacek, designer of special electrical and mechanical apparatus, and for many years located at Sturgeon Bay, Wis., has removed to Chicago. Mr. Hamacek is placing on the market a series cut-out for arc lighting.

A company to be known as the Vibrachord Company has been incorporated in St. Louis, Mo., to manufacture and deal in electrical appliances. Among the incorporators are Fred H. Brown and John J. Joyce. The company is capitalized at $50,000.

The Ford Electric and Manufacturing Company of St. Louis has purchased the manufacturing plant and equipment of Rossiter, MacGovern & Co. in St. Louis, as the latter company desires to give more attention to its secondhand business. The company's plant is complete in every respect for the manufacturing of armature and field coils and the repairing and rewinding of electrical machinery of all kinds. Special machinery for special services will be designed and built, for which purpose the company has exceptional facilities.

A new comer into the electrical manufacturing field is the Williams Electric Machine Company of Akron, Ohio, financed by some of the best and strongest financial interests of that city. This company is placing on the market a full line of electrical clutches and electric-stopping or safety devices to be used in stopping machinery in case of accident to the operator. These clutches, etc., are the invention of Mr. H. A. Williams, who is the general manager of the company. This concern is also placing on the market a full line of electrical apparatus, both alternating and direct-current generators, motors, switchboards, controllers, etc., and also undertakes the installation of complete transmission plants, embracing clutches, safety devices, generators, engine motors, switchboards, line shafting and hangers, pulleys, etc., making a specialty of equipping plants complete and all ready for operation.

Sealed proposals are being invited until December 27th for furnishing the New York navy yard with a quantity of desk and bracket fans, panel boards, cable, generating sets and miscellaneous electrical supplies based on specifications which may be obtained at the navy pay office in New York or of the Bureau of Supplies and Accounts of the Navy Department, Washington. The bureau is also inviting sealed proposals until January 17th for furnishing the Mare Island and Puget Sound navy yards with a quantity of motors, generating sets, electric wire, cable and conduit, meters, circuit-breakers and miscellaneous electrical material. Blank forms of proposal may be had upon application to the bureau.

BUSINESS.

The United States metal polish and barkeepers' friend, a product manufactured by George William Hoffman of Indianapolis, Ind., received the highest award at the Chicago World's Fair and also at the Louisiana Purchase Exposition of this year.

H. J. Walser, manager of the A. & W. Electric Sign Company of Cleveland, writes to Pass & Seymour, Solvay, N. Y., to say that in the last two years he has used 60,000 or 70,000 of that company's No. 1072 electric sign receptacles, and that they have proved satisfactory in every way for exterior sign work. He recommends the receptacles favorably to the trade.

The Richardson Lubricating Company of Quincy, Ill., pioneer in the lubricating business, wishes to announce to the electrical trade that it is prepared to furnish lubricating oils and greases of all kinds adapted to electrical needs, and particularly calls attention to its Noxall dynamo oils, cup grease, crank case oil and curve grease. The company is entirely independent and guarantees the high quality of its products, which are subject to refund of money if not all that is claimed.

The Northern Electrical Manufacturing Company, Madison, Wis., recently received an order for three 150-kilowatt slow-speed generators from the Tennessee Coal, Iron and Railroad Company of Birmingham, Ala. The order was received through J. B. McClary & Co., representing the Northern Electrical Manufacturing Company at Birmingham. The Tennessee Coal, Iron and Railroad Company is the largest of its kind in the South, and the order was secured in competition with first-class manufacturing companies.

Machado & Roller of New York city, selling agents for the Whitney Electrical Instrument Company, are pushing a new bond tester which is light and compact and may be carried for long distances by the observer without fatigue. The tester shows on a scale the resistance of the bond in terms of the number of feet of lengths of uncut rail, the resistance of which equals that of the bond. It furthermore shows instantly whether the bond resistance is above or below a predetermined resistance. A single observer may by its use take accurate and rapid readings. The weight of the outfit is about six pounds and, in spite of the length of the scale, which is nearly 15 inches, it is compact and easily transported from place to place.

W. N. Matthews & Brother of St. Louis, the pioneers in the patented anchor business, report that their sales have steadily increased from the start. They first introduced the Stombaugh guy anchor about five years ago; since that time the demand has so increased that their sales for December, 1904, have been more for the first half month than for any other month since they have been selling the anchor. They recently received a gratifying indorsement of the Stombaugh guy anchor, in the nature of an order for 90 anchors to be used in connection with the installation of the De Forest wireless-telegraph masts at the four United States naval stations, Key West, Fla.; Guantanamo, Cuba; San Juan, Porto Rico, and Colon, Panama, on the Gulf of Mexico.

The new factory building of the Hope Webbing Company at Pawtucket, R. I., presents an interesting application of the fan system of heating and ventilation. In connection with an old building and contemplated additions the total cubic contents amounts to about 875,000 cubic feet. In this installation, made by the B. F. Sturtevant Company of Boston, Mass., the distributing ducts occupy no valuable space, for the heated air is forced through an underground system into vertical flues, which are built into the brick walls. From these flues the air is admitted in the usual manner through openings placed about eight feet above floor level. With this arrangement it is possible to concentrate all of the heating surface in a single fireproof casing in connection with the fan, and to eliminate from the entire building all extended systems of steam piping.

A memorable incident of the morning following the close of the St. Louis Exposition was the formal shutdown and inspection of the 600-horsepower Westinghouse steam-turbine generating unit in the Palace of Machinery, after a continuous run of over 3,062 hours—a performance which, it is said, has had no parallel in steam-turbine history. This machine was started on its long run at 9:20 o'clock

on the morning of Monday, June 20th, shortly after its installation at the Fair, and was stopped at 11:32 o'clock on the morning of Friday, December 2d. Charles F. Foster, chief operating engineer of the Exposition, H. M. Holman, supervising engineer at the government exposition gas-engine tests, formerly president of the St. Louis Board of Public Works, and a number of Westinghouse representatives, including Wallace Franklin of Detroit, C. C. Chappelle of Chicago and W. K. Dunlap, managing director of the Westinghouse exhibits, were present when the engine was stopped. It was found to be in perfect condition, and there were no signs of wear, the bearings still retaining the tool marks as they had come from the shops.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued (United States Patent Office) December 13, 1904.

777,061. Cigar Lighter. James I. Ayer, Cambridge, Mass., assignor to the Simplex Electric Heating Company, Boston, Mass. Application filed June 15, 1903.

An electric cigar lighter comprises a casing having an opening for the insertion of a cigar, means for establisbing an electric arc opposite the opening, and means for automatically screening the arc from the user while lighting tbe cigar.

777,067. Automatic Fire-alarm Transmission. George B. Bowell, West Kensington Park, England, assignor to the Pearson Fire Alarm System, London, England. Application filed July 7, 1902.

In a fire-alarm installation are a transmitter consisting of a code break-wheel, escapement clockwork driving the code wheel, brusbes bearing on the code wheel, a magnet, a magnet-armature that when released locks tbe escapement, and an eccentric on the break wheel.

777,091. System of Electrical Distribution for Electric Railways. Josef H. Hallberg, Cincinnati, Ohio. Application filed March 14, 1904.

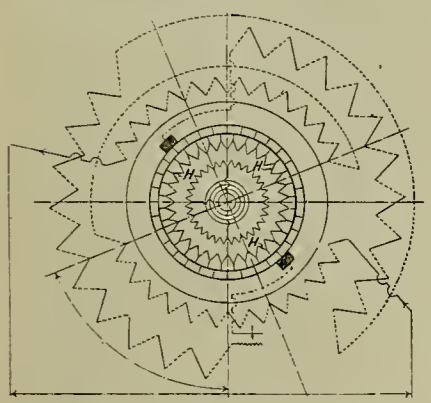
A source of polyphase current is connected with a motor vehicle with means for starting and operating the vehicle by a single pbase of the current transformed into a continuously symmetrical polyphase current when on a portion of the railway and by all of the current pbases when on otber portions of the railway.

777,092. System of Electrical Distribution for Electric Railways. Josef H. Hallberg, Cincinnati, Ohio. Application filed March 26, 1904.

A system of electrical distribution comprises a source of alternating single-phase current, means for modifying the voltage of the current, means for converting the current into polyphase currents of lower voltage and polyphase motors actuated by the polyphase currents.

777,106. Casing for Electric Push Buttons. Henry F. Keil, Bronxville, N. Y. Application filed May 17, 1904.

In a push button are a knob or button, a base having a central recess formed by shoulders and also recessed portions formed beneatb tbe edge or rim of the base, an insulated push-button back piece to rest in tbe central recess, circuit-changing springs to rest on the latter, and a cap or cover baving projections to engage the peripheral recesses and to bold the knob against one of the circuit-changing springs.



NO. 777,198.—ALTERNATING-CURRENT MOTOR.

777,116. Automatic Rheostat. Robert J. Louis, New York, N. Y. Application filed March 4, 1903.

In combination with a rheostat comprising a drum wound spirally with resistance wire are a screw spindle supported longitudinally of the drum, fingers in contact with tbe resistance wire and movable by the screw spindle, means for rotating the drum and screw spindle and means at each end of the drum for reversing the direction of rotation of the drum and screw spindle.

777,118. Emergency Brake. George Macloskie, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed March 21, 1903.

Associated in the controller are a controlling handle, a brake actuated by fluid pressure, a valve for controlling the operation of the brake, means for operating the valve to cause the brake to be applied when the controlling handle is released by the operator, a reversing switch and means operated when the actuating mechanism for the reversing switch is moved into its neutral position to operate the valve to cause the brake to be released.

777,124. Magnet Contact for Propulsion of Cars. James M. Morgan, Toledo, Ohio. Application filed July 28, 1904.

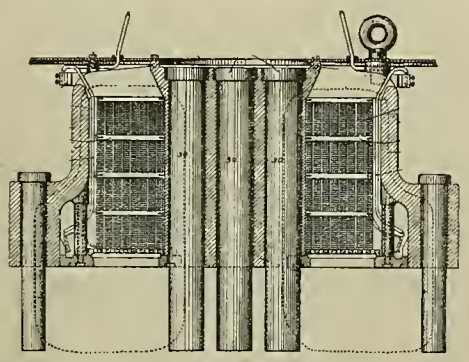
Combined with a sectional conductor rail comprising an oval cap portion having a tapered groove in its under side and a base portion having a longitudinal groove therein are a feed wire associated witb the rail, an armature pivotally mounted in the groove in the base portion and having connection with the feed wire and a portion tapered to seat within the groove in the cap portion, an elemeot movable over the rail and means carried by the element adapted to energize the armatures in the rail as tbey are passed over to have contact with the cap portion of the rail and communicate an electric current thereto.

777,142. Globe. Solon O. Richardson, Jr., Toledo, Ohio. Application filed July 5, 1904.

An inner globe for arc lamps is described.

777,146. Electric Arc Lamp. Lafayette E. Safford, Allegheny, Pa., assignor to the Keystone Electric and Manufacturing Company, Pittsburg, Pa. Application filed August 19, 1903. Renewed May 18, 1904.

In an arc lamp are combined a suitable frame, an electromagnet supported thereby comprising an upper and lower plate, disks of insulating material between the convolutions of the coil, a sleeve of insulating material inclosing tbe coil on the outside, a tube inclosing the coil from end to end and means for retaining the upper and lower plates in position.



NO. 777,221.—LIFTING MAGNET.

777,148. Magnet Coil. Albert Schweitzer, Pittsburg, Pa., assignor to the Keystone Electric and Manufacturing Company, Pittsburg, Pa. Application filed August 9, 1901. Renewed May 18, 1904.

As a new article of manufacture, the electromagnet comprises a spiral coil composed of a strip of insulating material wound to form convolutions and a series of mica disks slit from their edges toward their centers and arranged between the convolutions of the coil with tbeir slits embracing the convolutions.

777,153. Contact Device for Electric Self-playing Musical Instruments. Irving B. Smith, Philadelphia, Pa., assignor to the Stokes & Smith Company, Philadelphia, Pa. Application filed July 14, 1904.

An electrically operated musical instrument having electrical means for controlling the operation of the sound-producing devices, embodies also a contact device comprising in part a series of sets of selectors in circuit with the electrical means, each set of selectors consisting of at least two fingers, one of which is located adjacent to and slightly in advance of the other.

777,164. Electric Make-and-break Mechanism. James C. Waldo, Sharpsburg, Pa., assignor of one-fourth to John J. Forster, Avalon, Pa. Application filed October 19, 1903.

Make-and-break mechanism having in combination two contacts, a part or member movable to engage one of tbe contacts is described. Means are provided for shifting the engaged part and contact, means for retarding such movement, means for separating the part and contact and means for relieving the contact to normal position.

777,172. Telephone Attachment. Herbert G. Addie, Cresco, Iowa. Application filed May 20, 1904.

An attacbment for telephone circuits comprises a condenser, a casing inclosing and conforming to the condenser and having an aperture through its wall, a binding post on the casing and a conductor between the binding post and one side of the condenser. An insulated wire is partly within the casing, being connected with the other side of the condenser and extending through tbe aperture.

777,194. Variable-speed Dynamo. Arthur J. Farnsworth, New York, N. Y., assignor to the Railway Electrical Improvement Company, New York, N. Y. Application filed August 1, 1902.

A variable-speed generating device baving a magnetic field the strength of which is substantially independent of tbe speed variations is associated with a generating circuit relatively movable at a variable speed within the field and means for producing a corrective electromotive force in the circuit comprising a magnetic field, the strength of which varies with the relative movement of the generating circuit at a greater rate at low speeds than at bigh speeds and within which field tbe generating circuit is also relatively movable.

777,198. Alternate-current Motor. Valère A. Fynn, Bradford, England. Application filed September 17, 1903.

In a single or polyphase motor are a stator, a rotor, a commutator and brusbes and a main and an exciting winding on the stator. The exciting winding is displaced with respect to tbe main winding by an angle adapted to give an exciting electromotive force corresponding in phase with the electromotive force produced at any selected points of the rotor commutator in asynchronous running. (See cut.)

777,216. Apparatus for Wireless Telephony. Sigmund Musits, Steinamanger, Austria-Hungary. Application filed November 24, 1902.

Apparatus for wireless telephony embodies a primary circuit comprising a source of electricity and microphones cut into the primary circuit. A secondary circuit is adapted to be influenced by the primary circuit, a telephone is cut into the secondary circuit, a microphone is adapted to be actuated by the telephone and metal cylinders are placed in the secondary circuit, embedded in the ground.

777,217. Telephone Service Meter. Frank R. McBerty, Evanston, Ill., assignor to the Western Electric Company, Chicago, Ill. Application filed April 16, 1900.

In combination with a telephone line and a service meter associated therewith are an actuating circuit for the service meter and means for closing the circuit to operate the meter. A locking circuit for the meter is brought into action in the control of the meter, the locking circuit being controlled by the plug and spring jack of the called line. The locking circuit is rendered inoperative when connection with the called line is broken.

777,221. Lifting Magnet. Stephen Piek, Buffalo, N. Y. Application filed October 9, 1903.

A single magnet coil is arranged with its windings borizontal. A number of pole pieces are placed in the field of the coil and are movable at right angles to the windings of the coil. (See cut.)

777,246. Rheostat. Henry H. Cutler, Milwaukee, Wis. Application filed November 21, 1902.

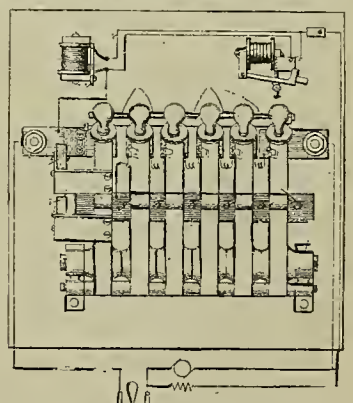
The claims specify a movable element, a retaining magnet for the element, means for returning the latter to its initial position, a thermostat responsive to the heat generated by the rheostat and a switch controlled by tbe thermostat for closing a shunt circuit around the magnet when the heat produced by the rheostatic resistance exceeds a prearranged temperature. (See cut.)

777,250. Submarine Telegraphy. Isidor Kitsee, Philadelphia, Pa. Application filed February 5, 1904.

Telegraphically transmitting messages is accomplished by impressing upon the line successive impulses of opposite polarity, each successive impulse representing a telegraphic symbol or symbol element, one symbol being distinguished from another symbol by a difference in the time unit between two symbol elements.

777,290. Variable Inductive Resistance. Thomas B. Kinraide, Boston, Mass. Application filed May 25, 1904.

Opposite independent coils formed respectively in tbe opposite sides of an alternating-curent circuit co-operate with a magnetic field including opposite cores for the coils and mechanical means for varying the magnetic influence of the field on the current of the coils.



NO. 777,246.—RHEOSTAT.

777,301. Busy Signal for Telephone Exchanges. James L. McQuarrie, Chicago, Ill., assignor to the Western Electric Company, Chicago, Ill. Application filed April 1, 1901.

A local circuit including a resistance is associated with each telephone line having parallel branches one in each plug circuit. Each of the parallel branches is adapted to be closed in registering contacts of its plug and a spring jack of the line. A magnet in each of the parallel branches operates by a source of current in tbe circuit, the source of current and the several magnets being proportioned or adjusted to one another so that each of the magnets is adapted to respond to tbe flow of current in its branch when that branch alone is closed, but not to respond when the circuit of its branch is completed in sbunt of a branch already established at another spring jack of the line.

777,304. Trolley Pole. Andrew L. Prentiss, Buffalo, N. Y. Application filed February 23, 1904.

A trolley pole having an upper section is movable relatively to its lower section. A rotary disk, a spring connected with the disk, a clutch band applied to the disk and having one end connected therewith, a tigbtening lever connected with tbe opposite end of the band and an operating connection between the lever and the upper section of the trolley pole, complete tbe apparatus.

777,310. Telephone Disinfecting Device. William H. Rose, Catonsville, Md. Application filed September 3, 1904.

A vessel containing a disinfecting substance is attacbed to the mouthpiece of the telephone.

777,312. Multiplex Telegraph System. Harry Shoemaker, Philadelphia, Pa., assignor of one-half

to Marie V. Gehring, Philadelphia, Pa. Application filed January 18, 1904.

In a multiplex telegraph system are a master sunflower, a controlled sunflower, means for impressing upon the circuit impulses representing a number of independent messages and means responsive to the impulses for maintaining the controlled sunflower in synchronism with the master sunflower.

777,324. Telephone System. Charles Adams-Randall, Boston, Mass. Application filed December 22, 1903.

A telephone transmitter is arranged in a local circuit at one end of the line; a battery is included in the local circuit, an induction coil has its primary forming a part of the local circuit and the secondary forming a part of the main line. An impedance is arranged in the line circuit, a receiver in the line circuit, and a condenser between the receiver and earth.

777,344. Sash Fastener and Burglar Alarm. Bedford T. Kavanaugh, Chicago, Ill. Application filed February 18, 1904.

Upon the upper part of the window sash is a plate which closes an electric alarm circuit when the window is raised.

777,372. Motor-driven Valve Mechanism. Ernest G. Howard, Springfield, Mass., assignor to the Chapman Valve Manufacturing Company, Springfield, Mass. Original application filed March 31, 1902. Divided and this application filed September 18, 1902.

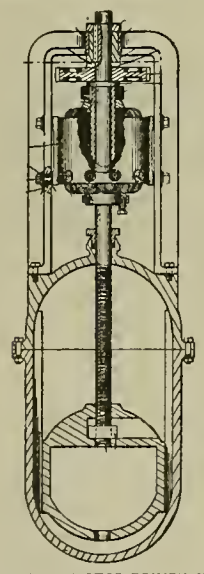
Valve mechanism adapted to be opened and closed independently either by hand or by power comprises a valve, a motor, a gate mounted in the valve body, a rotating non-reciprocating spindle arranged in the valve body to open or close the gate when the spindle is rotated and a train of gears arranged between the motor and the spindle whereby the spindle may be rotated when the motor is operated. A lost-motion device is arranged in the train and normally in position to cause the spindle to rotate when the motor is put in motion. A hand wheel and locking devices whereby the hand wheel and the spindle may be readily put into and thrown out of operative connection with the motor are also provided.

777,373. Motor-driven Valve. Ernest G. Howard, Springfield, Mass., assignor to the Chapman Valve Manufacturing Company, Springfield, Mass. Original application filed May 15, 1902. Divided and this application filed September 18, 1902.

In combination with a valve provided with a rotatable non-reciprocating spindle are a motor having a tubular armature shaft encircling the spindle, intermediate gear connecting the spindle and the tubular shaft and a member for manually rotating the spindle, adapted also to serve as a balance wheel when the spindle is rotated by the motor. (See cut.)

777,374. Motor Disconnecting Mechanism for Valves. Ernest G. Howard, Springfield, Mass., assignor to the Chapman Valve Manufacturing Company, Springfield, Mass. Application filed January 20, 1903.

A valve housing, valve and valve actuating spindle, a motor, connecting mechanism interposed between the motor and the spindle, a clutch introduced into the connecting mechanism to establish and destroy at will the driving connection, a hand wheel frictionally connected with the spindle and means for locking the hand wheel to the spindle are the features of importance.



NO. 877,373.—MOTOR-DRIVEN VALVE.

777,429. Party-line Telephone System. Walter Parker, Leicester, N. Y. Application filed January 13, 1904.

Party-line telephone systems of this class contain a number of movable switch hooks disposed at different stations, lines for connecting one station with another and a commutator at each station, the commutator being provided with separate contacts severally connected with the lines. The commutator is also connected by a ratchet connection with a switch hook and controllable by movements thereof for shifting circuits from one of the lines to another through the agency of the contacts.

777,439. Rheostat. William L. Schmidt, Easton, Pa., assignor of one-half to William S. Brotzman, Easton, Pa. Application filed June 7, 1904.

Oppositely turning winding drums, one of which is made of conducting material while the other is made of non-conducting material and which are provided with one or more conductors wound thereon, are geared together. Suitable cross connections are made by which the conductors are linked together and put in circuit when wound upon the non-conducting drum.

777,468. Holder for Trolley Wires. Frank M. Zimmerman, Aurora, Ill. Application filed September 16, 1904.

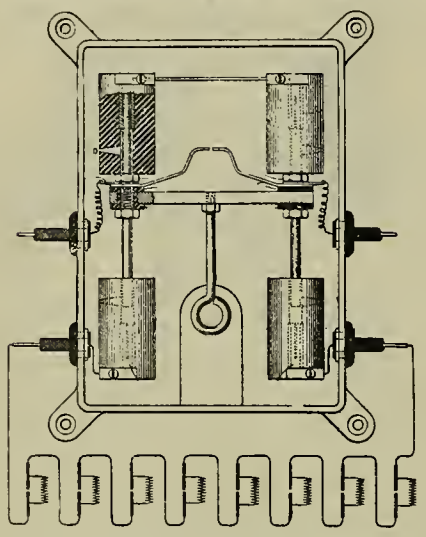
A wire clasp having a stem integral with the clasp and provided with a flange has also an interiorly chambered insulating block and means to insert the stem rotably into the block.

777,489. Speed-governing Apparatus for Electric Motors. Hiram A. Bond, Springfield, Mass. Application filed October 21, 1903.

An electric motor is provided with a controller having a movable controller-governing member. A mechanical governor is connected with and driven by the motor, and has a movable member. A lever engaged by the movable member, a rack bar connected with the lever, a gear wheel with which the rack bar meshes, a second gear wheel rotable in unison with the first gear wheel and a bar having a rack-toothed portion in mesh with the second gear wheel and having a connection with the movable controller governing member are the other parts.

777,490. Electric Arc Lamp. Hugo Bremer, Neheim, Germany, assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed March 26, 1902.

Parallel or converging electrodes with restraining means for holding the electrodes in position, means for releasing the electrodes, an electro-magnetically operated arc-striking and electrode-arresting device and means operated by the forward movement of the arc-striking device for short-circuiting the electromagnet which operates the same are described.



NO. 777,631.—SWITCH FOR ARC LIGHTS.

777,503. X-ray Tube. Robert Friedlander, Chicago, Ill. Application filed September 12, 1904.

A compound terminal is arranged in an X-ray tube comprising a gas-absorbing and a gas-evolving element.

777,506. Thermo-electric Alarm. Anton Haslinger, Allegheny, Pa. Application filed April 30, 1904.

A thermo-electric alarm for use in connection with gas stoves is described.

777,510. Portable Light. Conrad Hubert, New York, N. Y. Application filed July 21, 1904.

A portable electric light comprising a casing and a battery therein contains a body of insulating material and a cover of conductive material. An electric lamp carried by the conductive cover contacts at one terminal with one terminal of the battery, and a resilient circuit closer carried by the conductive cover is arranged to close the circuit by direct contact with the battery.

777,525. Telephone Toll Apparatus. George A. Long, Hartford, Conn., assignor to the Gray Telephone Pay Station Company, Hartford, Conn. Application filed January 5, 1903.

Combined with a channel board having one or more channels adapted to receive a coin and guide it in its passage across the board and signal devices projecting into the channels and adapted to be operated by the coin in its passage is a trap to prevent the retraction of the coin after it has passed beyond the signal devices. The trap comprises an opening through the board in the channel and a guideway from the opening to the edge over which the coin drops from the channel board. The guideway where it leaves the opening is of substantially less width than the opening and flares outwardly toward the edge.

777,535. Burglar Alarm. Joseph W. Pickens and Albert J. Ross, Jonesboro, La. Application filed August 8, 1904.

The circuit of an alarm bell is so connected with a lock that the insertion of a key will close the circuit.

777,536. Electric Controller. Weston A. Price, Cleveland, Ohio, assignor to the Electric and Dental Specialty Company, Cleveland, Ohio. Application filed February 24, 1903.

A conductor formed in convolutions is associated with means for rotating the conductor. A contact member is arranged to contact successive portions of the conductor during the rotation and means are provided upon the exterior of the cover to indicate the rotations of the conductor.

777,544. Telephone System. John G. Roberts, Detroit, Mich., assignor to the Kellogg Switchboard and Supply Company, Chicago, Ill. Original application filed December 15, 1899. Divided and this application filed February 24, 1902.

In the telephone system are combined with a telephone line a source of current and a relay bridged between the two limbs of the talking circuit of the line. A second relay and means for energizing it, a switch at the sub-station, a switch at the central station for controlling the circuit through the relays and a signal controlled by the conjoint action of the relays are the other features of the system.

777,555. Electric Signaling System. Howell W. Souder, Tamaqua, Pa., assignor of one-half to W. D. Zehner, Lansford, Pa. Application filed July 28, 1903.

Several electric lamps are connected in series and a like number of resistances are permanently connected one in shunt about each lamp. Each resistance is of approximately four times the resistance of its companion lamp. A current-supply circuit for the lamps has a potential which exceeds the total voltage of the lamps in series by an amount approximately equal to the voltage of one of the lamps.

777,581. Trolley Pole. John L. Young, Columbus, Ga. Application filed August 26, 1904.

The trolley wheel is mounted on a pole consisting of a lazy-tong construction.

777,583. Sanitary Attachment for Telephone Transmitters. Henry Baethig, Buffalo, N. Y. Application filed April 25, 1903.

An attachment for a telephone transmitter comprises a support or holder for a package of sheets. A suspension arm projects forwardly from the lower portion of the support and a guide rod adapted to pass through the sheets is secured at its inner end to the support and has its outer end detachably connected with the suspension arm.

777,598. Method of Removing Static Electricity from Paper, Yarn, etc. William H. Chapman, Portland, Maine, assignor to the Portland Company, Portland, Maine. Application filed January 25, 1904.

Neutralizing a charge of static electricity in a body is accomplished by passing it through a field of alternating static electricity.

777,599. Apparatus for Removing Static Electricity from Paper, etc. William H. Chapman, Portland, Maine, assignor to the Portland Company, Portland, Maine. Application filed February 8, 1904.

Apparatus for neutralizing charges of static electricity in moving paper or other like substance consists of a conductor stretched adjacent to the surface of the moving substance, a transformer connected with the conductor, a resistance in the primary circuit of the transformer, means for varying the resistance and means for supplying an alternating current.

777,607. Mouthpiece for Telephone Transmitters. Arthur B. Cruickshank, London, England, assignor to himself and Archibald Edward Rykert, Paris, France. Application filed July 27, 1904.

A mouthpiece for telephone transmitters comprises a bell-shaped member, a plate having perforations therein and lying flatwise on the rim of the bell-shaped member, a ring having a circular recess, an absorbent material filling the recess, means for connecting the plate to the rim of the bell-shaped member and means for connecting the ring to the plate.

777,612. Automatic Danger Signal for Elevator Gates. Charles T. Eaton, East Somerville, Mass. Application filed May 18, 1904.

A danger signal for elevators involving an electric circuit and a battery is composed of contact breaker on the elevator car which is connected with an alarm circuit. Circuit changers intermediate the floors are adapted to be actuated by the car contact breaker.

777,616. Electric Trolley. Theophile Euphrat, Norwalk, Conn., assignor of three-fourths to the Hurward Manufacturing Company, and George J. Tischer, New Haven, Conn. Application filed April 13, 1904.

An ice-detaching conducting wheel carried on the pivot of the usual wheel is normally maintained in disconnected relation to the wire. Means are provided for shifting it into connection and maintaining it in substitution for the usual wheel.

777,631. Switch for Arc-lamp Circuits. Robert H. Henderson, Newark, N. J., assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed March 20, 1903.

Combined with a main supply circuit carrying alternating currents are a local consumption circuit and a switch for cutting the local circuit out and in, the terminals of the switch being inclosed in small chambers arranged in pairs. Members of each pair are axially in line with each other and contact pieces are adapted to make contact at opposite ends with the switch terminals. (See cut.)

777,637. Rheostat. Charles H. Keeney and Charles A. Rhine, Milwaukee, Wis. Application filed February 29, 1904.

Magnetic retaining means for a spring-actuated switch member control a switch actuated by the lever. Means are added for deenergizing the magnetic retaining means controlled by the movements of the switch while the lever is retained by the magnetic device.

EXPIRING PATENTS.

Following is a list of electrical patents (issued by the United States Patent Office) that expired on December 20, 1904:

374,959. Dynamo-electric Machine. J. Gray, Medford, Mass.
375,001. Electropneumatic Mechanical Movement. A. Roosevelt, New York, N. Y.
375,007. Galvanic Battery. J. Serson, Boston, Mass.
375,034. Carbon Electrode for Galvanic Batteries. C. H. Wilder, Natick, Mass.
375,118. Electric Gas-lighting Apparatus. C. B. Bosworth, Everette, Mass.
375,238. Electrical Circuit-closer. M. M. Welch, Atlanta, Ga.
375,243. Thermo-electric Generator. E. G. Acheson, Pittsburg, Pa.
375,255. Combined Electric Motor and Fan. H. H. Blades, Detroit, Mich.
375,295. Insulated Electrical Conductor. A. Kissel, Salem, Mass.
375,299. Municipal Telegraph. M. Martin, Malden, Mass.
375,315. Mechanical Telephone. W. H. Eastman and D. J. Adams, Concord, N. H.
375,316. Mechanical Telephone Exchange. W. H. Eastman, Concord, N. H.
375,014. Cut-out for Electrical Distribution Apparatus. M. M. M. Slattery, Woburn, Mass.

WESTERN ELECTRICIAN

LIBRARY OF ELECTRICAL ENG'G

Hydro-electric Plant for Small Industries at Hagnech, Switzerland.

By Franz Koester.

In order to utilize the water of the Aare River a canal was built between the years 1870 and 1880 connecting the river with the Lake of Biel in the western part of Switzerland. This canal is 8.6 kilometers long and was built for the purpose of draining the turf land—"the Great Moor"—and to prevent damage which might arise from sudden high waters.

At the time of building the canal provision was made for the erection of a power plant, but the construction was delayed until a few years ago. The canal for a distance of 3,000 feet from its entrance into the Lake of Biel had to be cut through a hill giving a depth of 111.5 feet and a width at the base of 118 feet. Due to this cut a considerable fall of water was obtained. The head-water canal leading to the power house, as shown in Fig. 2, is 650 feet long and is at an angle of 45 degrees to the main stream. The power house spans this canal and a tail race 1,400 feet long leads from it and empties into the Lake of Biel. For checking the fall of the water from the Aare, this fall being 29.5 feet, a massive dam provided with sluice gates was constructed, the sluices being 100 feet below the supply canal. The law of the state required that the dam be built at least 10 feet above the bed of the canal so as to provide a minimum depth of 10 feet of water. Owing to the nature of the soil through which the canal runs it was found necessary to line the bed and strengthen the sides. The dam is 207.9 feet wide, spanning the entire canal, and is built 466 feet from the entrance of the canal into the Lake of Biel. The dam is divided into three parts and is built with heavy concrete piers which rest on solid foundations.

On the right side of the dam an overflow is provided for allowing the escape of the surplus water and also the floating ice which may collect in the canal. The ice trap may be operated either by an electric motor or by hand. To the left of the overflow are two sluice gates, which are operated by electric motors. These gates are each 32.8 feet wide and are made up of steel plates and stiffened by steel lattice work on the inside. The gates are balanced by counterweights and slide on roller bearings between the piers. The remaining part of the dam, which is 75.4 feet long, is provided with numerous small shutters, which are hinged at the low-water level, the top of the shutters bearing against the bridge which spans that portion of the dam. A traveling crane moves over these shutters, raising or lowering them, in order to regulate the height of the water. At times of very high water these shutters may be lowered so as to rest on the downstream incline of the dam.

The downstream side of the dam is built on a slope of one to 10 in order to prevent the washing away that would occur with a direct fall. At the right side of the dam the canal runs in its natural bed. The supply canal is 88.5 feet wide at the bottom, the sides sloping from the top and being lined with stone. The bottom of this canal is above the level of the bed of the main stream, is lined with stone and slopes toward a trench in the center, so that by opening the sluice gates in the dam the water may be entirely drawn out of the supply canal.

In order to prevent the accumulation of ice in the supply canal iron columns are built in concrete foundations in the canal bed. These columns are, when necessary, equipped with deflectors which prevent the ice from entering the canal. Before entering the turbine chambers the water passes through a rake in the canal, which removes any foreign matter that may have entered.

The power house is built for an ultimate equipment of five turbines, of which four are at present installed. Each turbine furnishes a minimum of 1,300 horsepower and a maximum of 1,500 horsepower. They were built by the firm of Bell & Co. in Kriens.

Each turbine consists of four sets of waterwheels mounted on a vertical shaft, the wheels being of the inside radial-flow type. The turbine is provided with two discharge chambers, arranged one above the other, which join before entering the tail race. The two lower waterwheels take water in at the bottom and discharge at the top, while in the two upper wheels the process is reversed, thus equalizing the strain on the shaft. The vertical shaft revolves on a double-ring bearing at the bottom of the turbine chamber, the bearing being enclosed and surrounded by 25 liters of oil, thus insuring efficient lubrication. The oil is kept cool by means of coils in which water is circulated. The regulation of the turbine may be effected in different ways; the two lower wheels may be regulated by an hydraulic governor, the two upper wheels may be regulated by hand and all four wheels together may be regulated either by hand or by means of the hydraulic governor.

In the summer time, when the flow is great and the head available small, all four wheels are operated; while in the winter time, when the flow is smaller and a large head obtainable, any wheel may be cut out of service as desired. The net fall at times of high water is 18.3 feet, and at ordinary

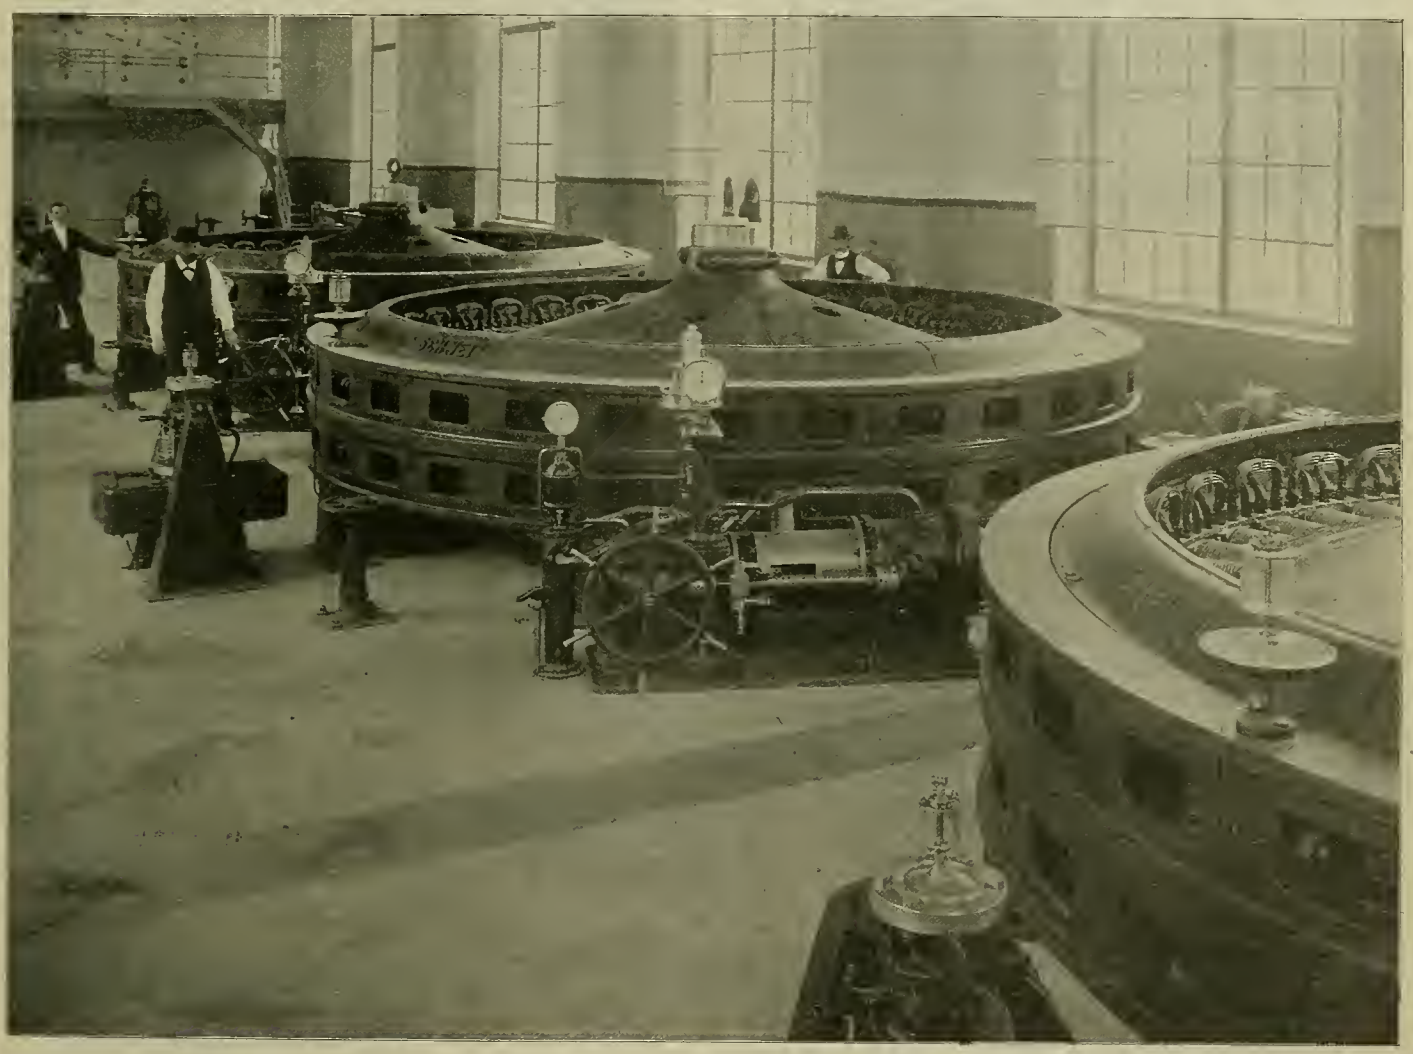

FIG. 1 HYDRO-ELECTRIC PLANT FOR SMALL INDUSTRIES AT HAGNECH, SWITZERLAND.—INTERIOR OF POWER PLANT SHOWING VERTICAL ALTERNATORS.

low water is 23.9 feet, while at times of extremely low water the fall is 29.5 feet. In the latter case the volume of water is 1,918 cubic feet a second, which is sufficient for operating four turbine sets. Each turbine is placed in a separate enclosed chamber from which the water supply may be cut off by means of two gates which move in a vertical plane.

In addition to the large turbines there are three smaller ones which receive their water from a penstock leading from the supply canal. Two of these turbines are of 20 horsepower each and operate the exciters, while the third turbine, which is of 45 horsepower, is used to operate an air compressor by means of which the gates controlling the entrance of the water to the main turbine chambers may be opened or closed. This may be accomplished in 1½ minutes. The last turbine also serves to drive the pumps for the hydraulic governors, each turbine having a separate pump. The turbine chamber may be emptied by means of a centrifugal pump.

The main turbines revolve at a speed of 100 revolutions a minute and are direct connected to the alternators, which are mounted on the same shaft, as shown in Fig. 1. The generators furnish three-phase current at 8,000 volts and 40 cycles per second. The revolving field contains 48 oval poles equipped with rectangular pole shoes at right angles to the poles. The armature is star-connected, the coils being placed in slots in the armature core, the outside diameter being 18.1 feet. The dynamos are so designed that they can develop their full-load output of 1,300 horsepower, giving single-phase current, so that they may at will be connected to the lighting system. The voltage loss in the generators with a non-inductive load is five per cent., and with cos $\Phi = 0.77$ the loss is 15 per cent., showing an efficiency of 94 per cent. and 93 per cent., respectively.

For single-phase operation, with a non-inductive load, the loss in voltage is eight per cent. and the efficiency 93 per cent. Each generator has a separate exciter, which runs at a speed of 550 revolutions a minute and which furnishes 230 amperes at 120 volts.

The exciters are driven by means of cone gearing from a shaft run by the 20-horsepower turbines; they are four-pole machines and separately excited by means of current furnished by small shunt-wound machines which furnish 100 amperes at 120 volts. There are two of these machines, one being held in reserve. The field current to each exciter is separately controlled by means of a rheostat on the switchboard, and the arrangement is such that when a generator is cut out of service a resistance is inserted in the field circuit.

Current from the generators is carried in cables, which are carried on porcelain insulators in roomy ducts to the switchboard, which is in the southern end of the building. The switchboard is arranged with two independent sets of bus bars arranged on the ring system, each set being capable of being broken at four points, so that the plant may be operated as a whole or may be divided into two independent parts—for lighting and for power. The 8,000-volt current is sent directly to the bus bars, the absence of transformers making the arrangement a very simple one.

The generator and distribution switchboards are separated, the latter being located in the rear of the former. The generator switchboard is divided into eight panels, three panels on either end of the board containing the equipment for the generators, which consist of two double-throw switches, an ammeter and voltmeter, a phase lamp and a voltmeter to be used for measuring the voltage in the phases when changing from three-phase to single-phase distribution. Below this equipment is placed the hand wheel of the field rheostat, so arranged that each rheostat may be operated singly, or that they may be coupled and operated in groups. The two center panels are for the bus-bar systems and are each equipped with three ammeters and a voltmeter arranged so as to be capable of measuring the tension at the bus bars of any part of the system to which it is connected. Each panel is also equipped with an ammeter and voltmeter, a rheostat and switch for the exciter-current system.

The distribution switchboard consists of seven panels and contains the switches and measuring instruments for the five high-tension feeder circuits, and in addition a ground detector is provided on the last panel. The bus-bar system is so arranged that any portion may be cut out during operation without causing any trouble or inconvenience. The lines from the distribution switchboard are led to lightning arresters, the arresters being grounded through fuses and water rheostats. The wires are led up the wall in cement ducts and leave the building on heavy glass insulators. A separate small switchboard located near the generator board controls the lighting for the power house and vicinity and also for the town of Hagnech. The current for lighting the power house and vicinity is furnished from a 15-kilowatt single-phase transformer, the distribution being on the three-wire system, with 250 volts between the outside wires. This transformer also furnishes the current for the town lighting. Motors for operating the sluices and gates in the dam are supplied by a 20-kilowatt transformer, which furnishes current in the secondary circuit at 250 volts, and the distribution is controlled from the small switchboard previously mentioned.

The high-tension wires are of copper 6.7 and eight millimeters in diameter. The lines from the building are led to a distributing pole made up of two latticed columns (Fig. 4), and from this point are branched in various directions, and furnish current to numerous industries widely scattered around the Lake of Biel. Near the power plant there is a test line one kilometer long, where aluminum wire is used.

The line to Biel (Fig. 3) consists of 11 wires and is carried on extra heavy double poles, while on the branch lines extra heavy single poles are employed, and at all railroad or water crossings the double-lattice column construction is used. All poles are provided with an iron framework around the top to prevent the high-tension wires from dropping to the ground in cases where an insulator breaks, and at all crossings a system of guard wires is used.

At the entrance to towns the lines are provided with emergency switches operated from the ground and also with lightning arresters, and where the lines run over mountains attaining an elevation of 3,280 feet a lightning arrester is provided on each pole.

The entire lighting system is single-phase, and all the current required is taken from the same phase, and, as the connected motors are all for three-phase current, the regulation of the potential at the power house is easily accomplished on the single phase which is used for lighting. The circuits are branched at the points of application, where are located one, two or three transformers as the demand requires. The transformers are located in small reinforced concrete buildings to each of which is anchored a sheet-steel tower (Fig 5). On the top of this tower are two rings of insulators—one for high-tension and one for the low-tension lines. The lines are led down the interior of the tower and supported by short span wires held in porcelain tubes.

High-tension wires run through three fuses, accessible from the rear of the building, to the transformers. The transformers are oil-insulated, the

Fig. 2. Headwater Canal Leading to Power House.

Fig. 3. Wooden Pole Construction.

HYDRO-ELECTRIC PLANT FOR SMALL INDUSTRIES AT HAGNECH, SWITZERLAND.

FIG. 4. LATTICE-POLE CONSTRUCTION USED IN HAGNECH SYSTEM.

FIG. 5. TRANSFORMER STATION OF HAGNECH SYSTEM.

single-phase type for lighting being from 15 to 30 kilowatts and the three-phase transformers for the motors being from 20 to 40 kilowatts. The transformers are arranged in groups in the station, the lighting transformers all furnishing single-phase current on the three-wire system. All the three-phase transformers for the motors furnish current at 250 volts. The secondary wires pass through fuses accessible from the front of the building and either lead directly to the point of application or to a system of bus bars in the station.

The distribution system serves numerous small towns and also the city of Biel, at which place about 500 kilowatts is used. Here a transformer station reduces the line tension to 2,000 volts and the current is led through underground cables to sub-stations, where it is further reduced to 250 volts for the motors. In addition to this, one phase of the transmission line is connected through a special transformer and furnishes single-phase current at 2,000 volts to a small electric plant at Boezingen. The turbine plant has proved satisfactory in every respect and despite the great number of motors connected to the system there has been no trouble experienced due to flickering of the lights.

In all the numerous points of consumption 1,150 kilowatts is consumed by the motors and 950 kilowatts for lighting purposes. This plant was built for developing the small industries in the city of Biel and towns around the lake and for furnishing power economically at a low cost. In connection with this plant there has been built a calcium-carbide factory at Nidaw, which has five furnaces and uses 2,400 horsepower. This plant is connected with the power house by a three-wire line, the current being furnished through the medium of three single-phase transformers. By building this factory it has been possible to utilize the entire output of the turbine plant, and should the demand for current to supply motors become great enough the supply to the carbide factory can be curtailed. Current for lighting (per lamp per year) and power is furnished at the following prices:

LIGHTING.

Candlepower	10	16	25	32
Over 1,000 hours	$2.70	$4.25	$6.60	$8.40
400 to 1,000 hours	2.10	3.20	5.00	6.40
Under 400 hours	1.40	2.10	3.30	4.20

MOTORS.

Horsepower	1-10	1	10	100
Price per horsepower year	$54.00	$42.00	$37.00	$29.00

From the above it will be seen that with a 100-horsepower motor running 11 hours per day for 300 days the cost of power would be 1.1 cents per kilowatt-hour. A reduction of 30 per cent. from the above price is made for motors using power during periods of no lighting load, and under favorable circumstances a still further reduction is made. The entire electrical equipment was done by Brown, Boveri & Co., of Baden, Switzerland.

Proposed Power Development for Chattanooga.

John Bogart, formerly state engineer of New York, who has been making investigations concerning the proposed development of waterpower on the Tennessee River for the city of Chattanooga, reports that the plan to develop waterpower and render the river navigable is entirely feasible. The city of Chattanooga has authorized the construction of a dam 35 feet high at a point 20 miles below the city. The dam is authorized by an act of Congress and will cost $2,000,000. Although the power plant will be 20 miles down the river, the transmission line for carrying the electrical energy to the city will only be six miles long, across country. It is said that 50 new manufacturing industries have sprung up in Chattanooga within 12 months and all desire to use the proposed electric power.

Electric Power in Railroad Shops at Danville, Ill.

Extensive and modern equipment is a feature of the new shops of the Chicago and Eastern Illinois railroad at Danville, Ill. These shops are located near the center of the system as far as distribution of material is concerned and present many features of interest to the electrical engineer. The grouping of the various shops close to the locomotive roundhouse is the fundamental idea of the whole scheme of construction. Among the things which have been introduced for the comfort of the employes is an efficient heating system known as the Van Auken duplex system of vacuum steam heating.

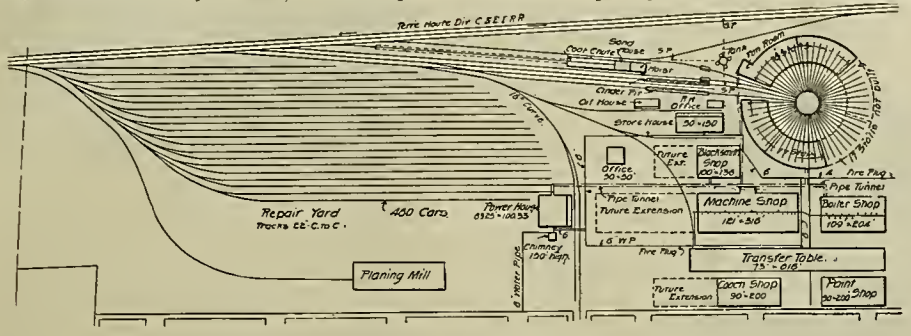

FIG. 1. PLAT OF GROUNDS FOR RAILROAD SHOPS AND YARDS AT DANVILLE.

One of the most important buildings is the machine and erecting shop, shown on the plat of the grounds (Fig. 1). Light for the shop is afforded by an abundance of glazed sash in the side and end walls, and there are skylights in the roofs of both sections. A single saw-tooth skylight over the light machine tools is arranged longitudinally.

The large shop is served by an electric crane having a span of 74 feet 6½ inches and a capacity of 80 tons. The crane has seven motors. Each trolley has an auxiliary hoist of 10 tons. Thirty-three per cent. of the floor space of the shop is served by the traveling cranes. Besides the main erecting shop other important buildings are the blacksmith shop, boiler shop, roundhouse and the power house.

The blacksmith shop is 100 by 136 feet, with walls 24 feet high, and lighted by the usual glazed windows. Specially hooded down-draft forges have been installed. A heating furnace for general purposes is located within the crane circle and in reach of one hammer. The boiler shop is a building 209 feet long and 109 feet wide. The crane in the middle section has a span of 55 feet and a capacity of 20 tons.

Ultimately the roundhouse is intended for 56 stalls, but 17 stalls opposite the entrance will not be built at present. The inside diameter is 124.8 feet and the extreme width of the house is 85.3 feet. A flat wooden roof is divided transversely into three sections, which are supported by circular cast-iron columns seven inches in diameter, three-quarters inch thick and about 20 feet long.

As in all of the latest types of railroad shops, electricity plays an important part principally in machine-tool drive and in lighting. The power house is a substantial structure, about 90 feet by 100 feet, outside dimensions, with coal bunkers 12 feet wide, running outside along the whole length. The building is fireproof throughout, with brick walls, tile roof on steel-roof trusses and cement floors laid on brick arches supported by steel I-beams. A 15-inch brick wall divides the building into two rooms, an engine room about 44 by 97 feet inside and a boiler room 41 by 97 feet, with a clear height of about 30 feet to the roof trusses.

Fig. 2 is a plan of the power house, showing the location of the apparatus, and Fig. 3 is an interior view showing the generating units. Fig. 4 is a cross-sectional view.

The engine-room floor is four feet six inches above that of the boiler-room floor, leaving a height of 25 feet in the engine room. Underneath is a basement eight feet 10 inches high. This arrangement of the power house with the three floor levels has been found very advantageous in the location of the various parts of the plant.

Particular attention has been given to the finish of the engine room. The walls are plastered and a wainscoting of white enamel brick seven feet high extends entirely around the room. The finish of all switchboard and gauge board instruments and of the lighting fixtures is uniform, a "marine" or black-copper finish.

In this room are installed the two generating sets, the compensator set, the two air compressors and the switchboard for the automatic-telephone system connecting the various shops. In the basement pit in plain view from the engine-room floor are the pumps and heater. All of this apparatus can be reached by the 12-ton traveling hand crane installed in the power house. The opening in the engine-room floor directly over the auxiliaries brings them at all times under the eye of the engineer and

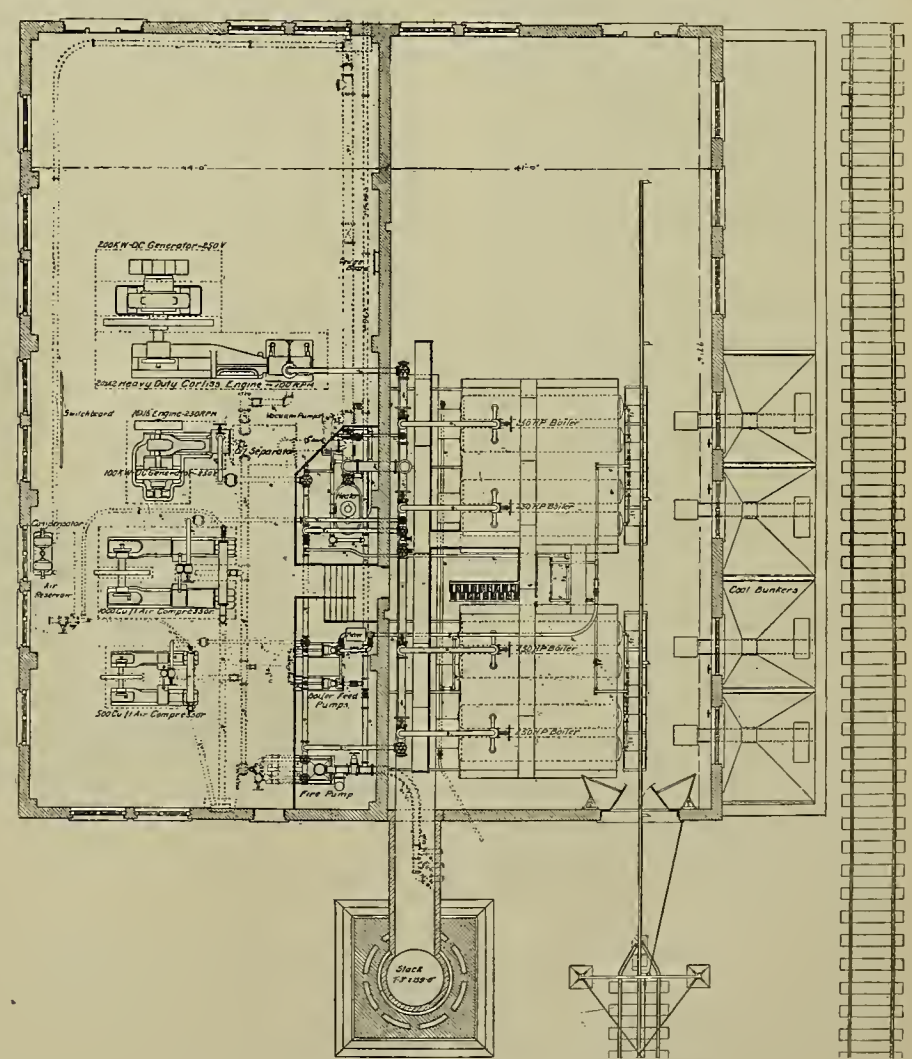

FIG. 2. PLAN OF POWER HOUSE FOR DANVILLE RAILROAD SHOPS.

provides a flood of light in the basement, this being most desirable for the inspection and repairing of piping and machinery.

The electrical system for power distribution is by direct current at 250 volts, the two-wire system being used for motor and power circuits and the three-wire system for lights, a compensator being used at the power station to take care of the unbalance in the lighting load. No reserve generating units have been provided, but every precaution has been taken to make the installation most certain in its operation. All generators, engines and compensators have an overload capacity of 50 per cent. for continuous operation and of 100 per cent. for short intervals.

Coal is delivered on the cars, which are run in on the track alongside the bunkers. From the cars it is shoveled into the bunkers by hand. The bunkers

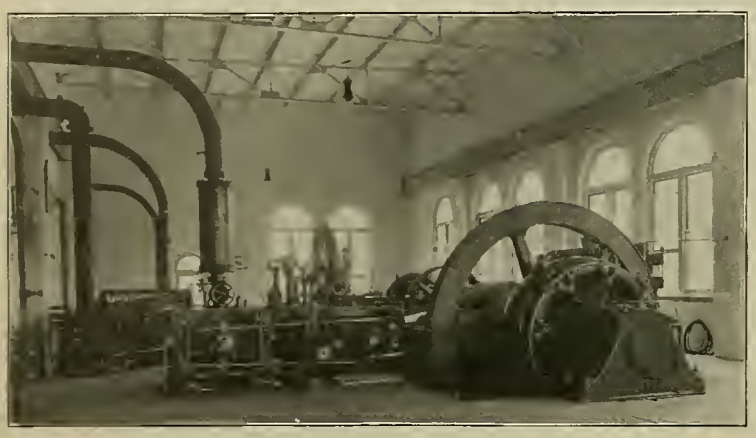

FIG. 3. INTERIOR OF POWER HOUSE AT DANVILLE RAILROAD SHOPS.

are hopper-shaped and at the bottom are provided with a trap door, through which the coal runs by gravity into the firing cars. These cars are drawn in through small doors in the boiler-room wall to the point directly in front of the boilers, from which the grates are fed by hand. Provision has been made in the construction of the bunkers so that the railroad tracks may be elevated, and when coal can be delivered in hopper cars these cars will be run over the bunkers and the coal dumped directly into them.

In the boiler room are installed at present four 264-horsepower Cahall horizontal sectional water-tube boilers, furnished by the Aultman & Taylor Machinery Company of Mansfield, Ohio. The boilers are set in two batteries of two boilers each. They are provided with all possible safety devices and are installed after the most modern practice. Each boiler is provided with two four-inch safety valves, ordinarily set for 100 pounds steam pressure, water columns, three trycocks, two Homestead blow-off valves and a Kirchner high and low-water alarm.

The total capacity of the boiler plant is about 1,000 horsepower. Space is left in the boiler room for the installation of another 500-horsepower battery, as the demand for more power may arise.

The grates have an area of about 55¼ square feet per boiler and are designed normally to burn about 22 pounds of coal per square foot per hour, this being a fair rate of combustion for the kind of coal used. However, the rate of combustion can be pushed much higher, as sufficient draft is provided by a chimney about 140 feet in height, it thus being able easily to take care of overloads that may occur in the operation of the plant.

The gases pass from the furnaces to a breeching made of 3-16-inch steel. The breeching is five feet wide by seven feet high at the smaller end, and 10 feet high at the larger end, the cross-section being rectangular with an arching top. This breeching will be extended the whole length of the boiler room when the future boilers are added to the plant.

The stack is of brick, 140 feet high by seven feet three inches internal diameter, and was furnished by the Alphonse Custodis Chimney Construction Company. The foundation is of concrete, the footing being 20 feet square and 10 feet below grade level. At the top of the foundation is laid a 12-inch course of Indiana limestone. The foundation footing is 10 feet from the outside of the power-house wall, and connection between the steel breeching in the power house and the stack is made by a smoke flue of brick five feet wide by 10 feet high, with arched top.

The engine room, shown in Fig. 3, is of ample size to accommodate all machinery now installed together with future extensions, allowing necessary space for repairs on machinery, yet without waste room. The large engine now installed is a 300-horsepower heavy-duty type horizontal simple Corliss engine, with shafting extended for mounting the 200-kilowatt direct-current generator. This engine is designed to develop 300 horsepower when running at 100 revolutions per minute, taking steam at 100 pounds pressure and one-quarter cut-off. It will carry continuously an overload of 50 per cent. without undue heating or wearing of the operating parts and will regulate within two per cent. each way from its normal speed under variations from no load to full load. This engine was furnished by the Filer & Stowell Company of Milwaukee, Wis.

The smaller engine is a 150-horsepower Ideal high-speed engine, furnished by A. L. Ide & Sons of Springfield, Ill. This also is a single-cylinder engine, arranged to be direct connected to a 100-kilowatt generator. The shaft for the generator armature is flange-coupled to the engine shaft instead of being built in one solid piece. This engine will develop 150 horsepower when running at 230 revolutions per minute, taking steam at 100 pounds pressure and one-quarter cut-off.

The generators were both furnished by the Western Electric Company of Chicago and are compound-wound multipolar 250-volt direct-current machines. The 200-kilowatt generator is designed to run at 100 revolutions per minute, while the smaller machine runs at 230 revolutions per minute. Both of these machines are designed to furnish 250 volts at full load and 245 volts at no load. They are each capable of operating continuously, delivering their full rated output at 250 volts without an excessive increase of temperature in the field coils or armature, and they will, moreover, carry a 50 per cent. overload for a period of two hours without excessive heating. Momentary overloads of 100 per cent. will be safely carried by either. The efficiency at full load is 92½ per cent. for the 200-kilowatt and 91 per cent. for the 100-kilowatt, while efficiencies for less than full loads, of course, are slightly below these figures.

The large generator is designed to carry the normal load of the entire plant during the daytime. On winter afternoons when the lighting load is thrown on in conjunction with the motor load it may be necessary to use the smaller unit in connection with the larger one. In case of injury to the large unit the smaller unit will be able to operate the entire plant for a limited time with possibly a decreased output. The night load will ordinarily be carried by the smaller unit.

The tunnel, about 1,200 feet total length, in which are laid the main piping lines, connects the power house with the various shops. The tunnel is rectangular in section, about six feet high by four feet six inches wide.

Forty-one motors are used throughout the shops for driving the various tools. Of these 11, ranging in size from five to 20 horsepower, used for the group drives, are belted to line shafts. Examples of these installations may be seen in Fig. 5. These motors are installed on brackets supported by building columns or attached to the wall. The starting boxes are mounted on the wall or on iron columns as may be convenient. These are all provided with

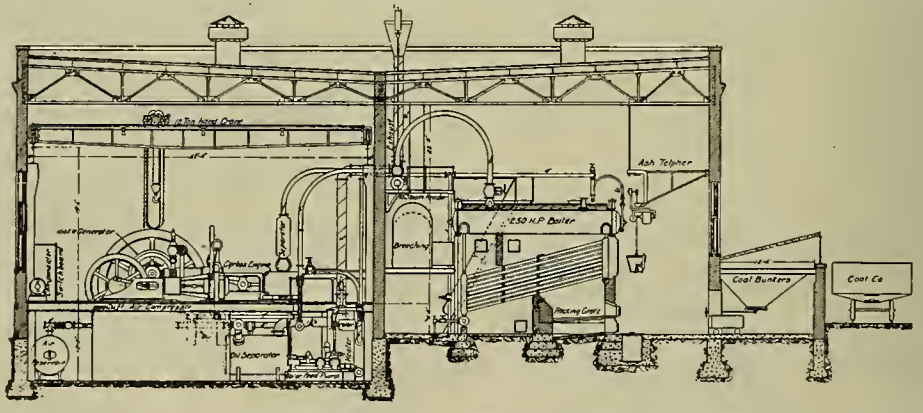

FIG. 4. CROSS-SECTION OF POWER HOUSE FOR DANVILLE RAILROAD SHOPS.

double-pole circuit-breakers which take the place of main switches.

Thirty motors ranging from 1½ to 25 horsepower are used for individual drives and are mounted on the machines they operate. The controllers are mounted on pedestals of special design which provide space in the base for necessary resistance. On the back of the controller is mounted the circuit-breaker, thus bringing all the operating mechanism within easy reach of the operator.

The variable-speed motors used for tools having a speed variation of four to one are of the double-commutation variety and operate on the 250-volt circuit. Three speeds are secured by combinations of commutators which about equally divide the total range and intermediate steps are obtained by a small amount of field weakening. No armature resistance is used to obtain a speed variation.

The controller for operating these motors is of unique and compact design. The controller proper is mounted upon a stand in convenient reach of the operator. Immediately below the controllers and forming one side is a slate slab, upon which is mounted a double-pole circuit-breaker, back of which is a small resistance bank. The three remaining sides of the stand are covered in with perforated iron. The controller of the largest motor, one of 20 horsepower on the 90-inch wheel lathe, only occupies a space of 14 by 20 inches by three feet six inches high. The controller is entirely self-contained, including resistance and protecting devices.

The 90-inch wheel lathe just mentioned, the largest tool in the shop, is deserving of particular attention. Its motor has a speed range of from 250 to 1,000. The controller is in easy reach of the operator, who can increase, decrease, stop or reverse the motor at will. There are no belts used on the tool, the feed being operated by a shaft and bell-crank attachment below the floor. The quartering attachments are operated by two individual three-horsepower motors and are controlled by separate controllers.

The transmission lines from the power house consist of three pairs of 700,000-circular-mil feeders for power circuits and two pairs of lighting feeders, one of 500,000 circular mils and the other of 400,000 circular mils. A pair of No. 2 wires are used for the outside arc lamps, which are on a separate circuit. A No. 0000 neutral wire is carried from the power house, with branches running to all lighting cabinets.

These feeders are of rubber-covered lead-encased cable from the switchboard to a point two feet outside the power-house wall, where they are connected to the triple-braided weatherproof insulated wire used on the pole line. The poles are of wrought iron, 25 feet in height, with malleable-iron cross-arms and iron pins. They are set in concrete blocks five feet six inches in depth and about three feet square.

For the power-distribution service leads are carried from the feeder line to a distributing panel provided with fused main switch and fused branches. The motor leads are tapped from the branch mains and are protected by service boxes which serve the purpose of both fuse and switch. The motors are further protected by circuit-breakers mounted on the starting boxes.

The service wires for the lighting circuits lead to panel boards installed in wooden cabinets. These panels are arranged for the three-to-two-wire system of distribution and are provided with a main fused three-pole switch and the requisite number of fused two-pole switches. For mechanical reasons, nothing smaller than 35-ampere switches are used on these panels.

There are 12 distributing panels for lighting circuits and two for power circuits located in convenient centers of distribution in the various shops. The wiring from the cabinets to lamps is openwork where possible, and in conduit where lines run under floor or on iron columns and along walls from the floor to a point seven feet above floor level.

In lighting the shops arc lamps have been used for general illumination and incandescent lamps have been located over the various machines and benches. In many places, as along walls in machine shop, over the benches, between the engine pits and in the tool room adjustable fixtures have been installed which will support the lamp in any position desired directly over the work. Otherwise the incandescent lamps are pendant over machines or mounted on side walls. The arc lamps are suspended from the roof or between columns at a height of not less than 16 feet from the floor level. Adams-Bagnall 110-volt direct-current enclosed-arc lamps have been installed both for inside and outside lighting. In the office building and storehouse incandescent lamps have been used exclusively as well as in the oil house, where they are installed in vapor-proof globes.

The wiring of the roundhouse is entirely different from that in the other buildings. Fig. 6 is a diagram showing the principles upon which the system is based. On account of the gases, it was desirable to have no exposed wiring, and conduits have been found to rust in a short time. The panel boards used in other buildings were dispensed with and instead the mains carried on the roof on cross-arms, supported on hollow wood masts, which extend through the roof and rest on the top of the seven-inch iron columns supporting the roof trusses. The branch circuits on leaving the mains pass directly to a service box installed on the mast. From the service box, twin wire, lead-incased, passes into the wood mast and continues down through the inside of the iron column to a point about six feet

FIG. 5. EXAMPLES OF MOTOR DRIVE IN DANVILLE RAILROAD SHOPS.

above the level of the floor. At this point a wooden box containing fuse blocks and switch is bolted to the side of the column. The twin cable passes through a hole drilled in the column into a box and to a fuse. From the fuse it passes through a switch, then back into the column and out at the top, whence it is laid along roof supports and down a one-inch iron pipe to the arc lamp. The lamp is provided with a special top, allowing the wires to pass directly to the terminals inside the lamp case. All of the wiring is thus entirely protected from the gases. In the side of the box containing the fuse block is mounted the flush switch controlling the lamp in that section of the roundhouse and two plug receptacles for lamp extension. The receptacles and plugs used in the roundhouse are of special design, so constructed as to pull out from any direction before a strain sufficient to break the extension wire can be brought to bear. This feature is particularly valuable in the roundhouse, where it often happens that the extension lamp is left in an engine through carelessness after use, and when the latter is run out of the stall either the extension cord is broken or the wiring torn out.

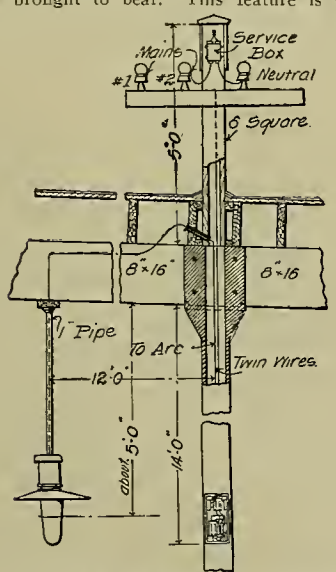

FIG. 6. ARC-LIGHTING SCHEME FOR ROUNDHOUSE AT DANVILLE SHOPS.

A complete telephone system is installed connecting all shops in the plant. The Automatic Electric Company of Chicago furnished this equipment. The automatic exchange is located in the power house, where it is under the eye of the engineer, who will be notified by suitable signal lamp of any failure in the operation of the system and who can at once rectify the difficulty. Additional telephones are added to the system by simply connecting the two wires leading from them to the exchange, as the banks in the exchange come wired to be used in sets of 100.

The Arnold Electric Power Station Company of Chicago did the engineering work for the plant.

Barclay's Printing Telegraph System.

Many will remember, no doubt, the paper read by Mr. J. C. Barclay, the assistant general manager of the Western Union Telegraph Company, on "Modern High-speed Printing Telegraph Systems," at the International Electrical Congress in St. Louis [Western Electrician, October 1, 1904]. In the paper the author mentioned the fact that he had then nearly finished certain improvements to the well-known Buckingham system, which would make it a practical commercial apparatus. It is, therefore, of interest to hear that a system of Mr. Barclay's has recently been tried and has operated with apparent success. The messages are sent by means of ordinary typewriter keys and are printed out at the receiving end in the form of letters. All that the sender needs to understand is the operation of a typewriter. It is said that the mechanism is simple and inexpensive and that the most expert typewriter cannot operate the keys fast enough to disconcert the telegraphing.

Electric Resistance Furnace for Laboratory and Dental Purposes.

Illustrated herewith is a simple, cheap and efficient electric resistance furnace, adapted for laboratory, dental and other uses, such as determining melting points of metals, calibrating thermo-electric couples by means of the melting point of copper, determining the cooling curves of steel, or for use for any chemical or physical operation when it is desired to reach quickly and accurately a desired temperature or to hold an object for a long time at a given temperature, and especially when it is desirable to do so in an atmosphere free from the products of combustion of any fuel or in any special atmosphere.

The furnace itself, as described in a patent recently issued to Mr. Henry M. Howe of New York, consists of two semi-cylinders of magnesia (A) (A'), hollowed to form the heating chamber and provided with a cover of magnesia (B) (B') and a stopper (C), also of magnesia, which is perforated to admit the leads (x) (y) of a thermo-electric couple. The furnace is heated by the spiral of platinum or other suitable wire (D) (D), entering and departing by the openings (I) and (K), through which a current of any desired strength is passed, bringing it to incandescence and to any desired temperature not above the melting point of the heating wire. The crucible (E), which is surrounded by the heating coil, is also preferably of magnesia.

It is not necessary that the magnesia of which the furnace is made should be absolutely pure. That used has the following composition: Silica, two per cent (determined accurately); ferric oxide and alumina, one per cent. (determined approximately); lime, two per cent. (determined approximately); magnesia, 95 per cent. (by difference).

Magnesia may be diluted with a certain amount of lime; but the amount should not be very great, because of the tendency of the lime to slake, and the less lime the better. The presence of any large amount of silica is objectionable.

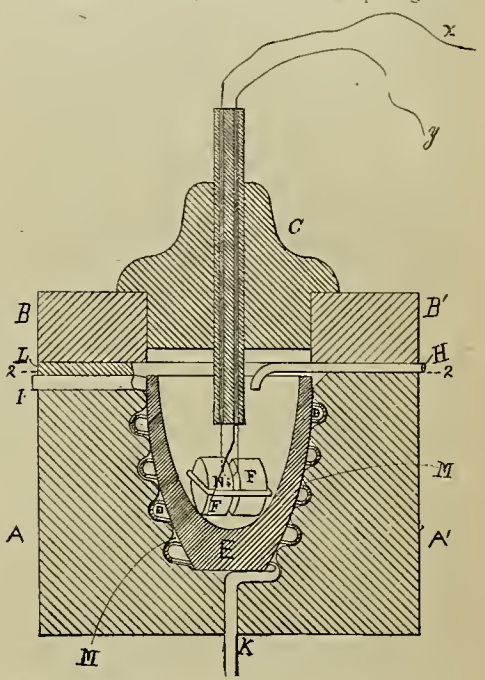
Unsuccessful attempts with furnaces of this general class have been made and the failures are attributed to the use of sileceous materials for the furnace walls. Of course, such a result might be expected, since the silica would readily be electrolyzed by the current and the resultant silicon would alloy with platinum and destroy it. But the magnesia furnace here described is said to be free from this objection. It has been used successfully in laboratory work, and temperatures up to 1,100° C. have been developed in it over considerable periods of time. Indeed, it has been held near 1,400° C. for about two hours without indication of any deterioration of the platinum.

Great care should be taken not to turn on an excessive amount of current, because this is liable to melt the platinum. The current should be controlled carefully with an ammeter and a differential rheostat. When beginning to use the furnace, the operator should first turn on the current slowly till the wire begins to glow. Then setting the thermoelectric junction of the pyrometer in place and closing the furnace, he should increase the current very slowly and cautiously, so as to learn just what current is required to produce within the furnace the temperature which he needs.

In the illustration (F) (F) are a pair of steel disks bound together, but separated by the inverted thermo-junction (N) of the thermo-electric pyrometer. This arrangement permits the observation and record of retardations in the heating and cooling of (F) (F)—in other words, the determinations of the cooling curves of steel—a purpose for which the furnace is well adapted, as well as for the determination of melting points. In calibrating thermo-electric couples by means of the melting point of copper, this apparatus permits the crucible to be filled with an atmosphere composed of equal volumes of carbonic acid and carbonic oxide, a gaseous mixture which does not oxidize copper and at the same time is unlikely to cause deposition of carbon. In such an operation the mixture of carbonic acid and oxide, or any other desired atmosphere, is introduced through a pipe (H), which, as well as the openings (I) and (K), may be tightly packed, while the cover (C) is luted on. Absolutely air-tight closure, however, is not required, since the gas pressure through (H) sufficient to maintain a plenum in the crucible and to offset small leakages will be a sufficient prevention of change of the interior atmosphere.

In order to increase its radiating surface, the spiral (D) may be made of flattened wire, and preferably of the special U-shaped section shown, so that it may be the better adapted to the groove, while giving a large heating surface.

To facilitate placing the spiral (D) in its groove molded within the furnace walls, a mandrel has been devised. The mandrel, with the wire wound upon it, is set approximately in place in the furnace. The mandrel is then withdrawn by screwing it to the left. The two halves of the furnace are at the same time pushed together, and the wire is thus fitted into the spiral groove made for that purpose in the inner faces of the furnace walls. The metallic conductor thus laid in the spiral groove in the chamber constitutes a large part of the interior wall of the heating chamber instead of being on the outside of the wall, as is common, so that the heat generated by the passage of an electric current through the wire is transmitted directly into the heating chamber by radiation instead of by conduction through the walls of the chamber.



ELECTRIC RESISTANCE FURNACE FOR LABORATORY AND DENTAL PURPOSES.

Chicago Street-railway Situation.

Judge Grosscup last week refused the application of the Chicago Union Traction Company to issue receiver certificates with which to meet various obligations. The court said: "What I shall do now is, to continue this hearing until December 31st. If at that time the Union Traction Company shall not have put into the hands of the receivers the sum needed January 1st, for interest and rentals; and by January 18th the sum needed for rentals January 20th; and by February 1st, the remainder of the sums immediately needed for the purposes named, and for adjusting the accounts between the underlying companies and the Union Traction Company—taking therefor the interest-bearing obligation of the receivers, resting on the property, but not cutting under the mortgages—the court will consider that the Union Traction Company's obligation, in that respect, has been defaulted, and steps accordingly will be taken."

Just how much money the eastern interests must raise to fulfill the terms of this order is a question. Unquestionably they will have to bring forth for interest payments about $180,000 by December 31st, $130,000 more by January 20th, and an additional $45,000 by February 1st—a total of something more than $350,000. But how much money is meant by the words "remainder of the sums immediately needed for the purposes named" will have to be determined at later hearings.

The financiers interested in the proposition to merge the Chicago City railway with the North and West Side companies agree that the decision has cleared the atmosphere considerably and put the traction problem in a way to be settled soon. The points gained by the underlying interests will, it is declared, give them more patience to await the outcome of the efforts of Marshall Field, John J. Mitchell and others to buy the South Side system. Then they will be able to treat with the capitalist for fair and square terms of effecting the merger.

WESTERN ELECTRICIAN

EVERY SATURDAY.

PUBLICATION OFFICES:
510 Marquette Building, - CHICAGO.
TELEPHONE, MAIN 1746.

Eastern Office, 193 Times Building, New York.
Telephone, 3806J Cortlandt.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—the only general electrical paper published in the West—thoroughly covers a territory *exclusively its own.* THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

REMITTANCES.—All checks, drafts and other remittances should be made payable to the order of the publishers, the Electrician Publishing Company, and addressed to the offices of publication, Suite 510, Marquette Building (204 Dearborn Street), Chicago, Illinois, U. S. A.

MR. W. FORMAN COLLINS, vice-president of the Western Electrician, was a man of high character, benevolent disposition and untarnished integrity. While his health had not been satisfactory for many years, his sudden death was nevertheless absolutely unexpected and very shocking. Mr. Collins was kind and considerate to his associates, very charitable to those less well provided with this world's goods than himself and thoroughly upright in his dealings with all men. He had a wide and comprehensive grasp of business affairs, and although of late years he had paid less attention to the routine of office affairs, by his physician's advice, yet his counsel and his active supervision of business matters, so far as he was able to give the latter, were highly prized. Mr. Collins' domestic life, too, was a notably beautiful one; he was ideally united to a wife who was his almost constant companion and closest friend—the confidant and trusted counselor of a high-spirited, retiring man who had few intimates. To the widow who is entering the New Year in the shadow of a great bereavement the Western Electrician offers its earnest sympathy.

ONE of the possible electrical benefits of the building of the Panama Canal by the United States is the laying of a submarine cable from Florida to the Isthmus of Panama, perhaps from Tampa to Colon. Such a cable would be of much usefulness, and is likely to be installed at some future date—just how soon no one can tell. The government of the United States has laid more cable within the last few years than most people are aware of. Already there is 2,000 miles of cable in the Philippines, laid by the Signal Service; and from 1,500 to 1,700 miles more connect the land-telegraph system of this country with that of Alaska. In fact, though several European powers anticipated the United States in the adoption of the policy, only one of them has a greater aggregate of cable under the control of the national authorities. France is credited with more than 5,000 miles, Germany with 2,600, and Great Britain and Japan with something like 2,000 miles each. Of course, the Panama cable may be laid and owned by a private company, as in the case of the American Pacific cable, but it will need government sanction and encouragement, and these should not be lacking.

COAL STORAGE on a considerable scale is now a feature of nearly all large central-station plants, and it is therefore of some importance to consider the possibility of spontaneous ignition. Such ignition is stated by a recent writer to be due to slow oxidation of the fuel, and the fact that the heat produced by this oxidation cannot escape, but seems to raise the temperature of the mass of fuel, only accelerates the rate of oxidation and increases the danger of spontaneous ignition. Anthracite coal does not heat in this way, but semi-bituminous and bituminous fuels are both liable to do so, and as a rule the danger increases with the increase in the percentage of moisture, volatile matter and sulphur. The customary method of minimizing the risk by placing air tubes or passages in the mass of fuel intensifies the danger, since it insures a supply of oxygen to continue the oxidation, but does not produce a sufficient current of air to carry off the heat generated, which therefore gradually rises. The amount of moisture present in a bituminous fuel after air-drying is stated to be a measure of the risk of spontaneous ignition when stored. Coals of this character containing above 4.75 per cent. of water are dangerous. Coal bins should be constructed of iron or steel protected by concrete, and should be roofed over; the depth of coal stored in them should never exceed 12 feet. No steam pipe or smoke flue should pass near the bin, and every effort should be made, by free air passages around its walls and below it, to keep it cool. Bins above boilers are dangerous as store places for coals liable to heat. For testing the temperature of a heap of fuel five-eighths-inch iron rods, made in sections which screw together, are very useful. These are simply pushed down into the coal heap to the required depth, left until they have arrived at the temperature of the fuel, and then withdrawn and tested by hand, or with a thermometer. An experienced man can easily tell by mere feeling when the temperature exceeds 140° F. (the danger limit). When the interior of a heap of fuel has ignited, it is not easy to quench it by playing water on the outside of the heap, since a ring of coked fuel is formed around the combustion area. A two-inch pipe with its lower end perforated with three-eighths-inch holes must be employed, and this must be pushed down into the fuel until the perforated portion has passed through the upper portion of the coked protective ring. The better plan is, however, to guard against ignition, by turning over the fuel when heating is observed.

SWITZERLAND is a country abundantly provided with waterpower, and the remark has frequently been made that the power thus obtainable would be sufficient to operate all the railways of the country. Though such a condition of affairs is, of course, far from being realized at the present time, the Swiss engineers are not backward in taking advantage of natural facilities at their hand, and in many quarters hydro-electric power developments are taking place for furnishing power to various industries. The leading article in this issue is devoted to the hydro-electric development at Hagneck, which has been worked out with the thoroughness as to detail characteristic of the European engineers. Power developed at the Hagneck plant is used to supply numerous small industries in and near that city. The generators furnish three-phase alternating current at 40 cycles per second, which is carried by high-tension transmission lines to numerous points of distribution, where, in transformer stations of unique appearance, as shown by a picture accompanying the article, the pressure is stepped down to the required voltage for distribution. The pole-line construction is noticeably substantial, as shown in the illustrations, especially the lattice-work poles, which are used where any considerable distance is to be spanned. As a whole the system is well worthy of study and embodies many points in the construction which vary widely from methods followed in this country.

SOME of the newspapers are wondering why none of the Nobel prizes has been awarded to an American scientist. Probably the reason is that comparatively little of the class of original work honored by these awards has been done in the United States. The quantity of research work in this country is, it must be admitted, small when compared with that of European nations. For instance, England has been granted two of this year's prizes, that for physics to Lord Rayleigh and the one in chemistry going to Sir William Ramsay. No one in the United States can quarrel with these names surely. Lord Rayleigh was senior wrangler at Cambridge in 1865, since when, by experimental and mathematical research, he has been a constant contributor to scientific progress. As one of our English contemporaries remarks, he is one of the greatest living authorities on acoustics, his "Theory of Sound" [1877] being still a standard work. His best known and perhaps most valuable discovery was the finding of argon in the atmosphere a decade ago. By a most refined chemical investigation, in the later stages of which he was associated with the other Nobel prize-winner, Sir William Ramsay, he demonstrated the existence of an inert gas, which was added to the list of elements under the name of argon. It is announced that Lord Rayleigh will present the value of the Nobel prize (about $39,000) to his alma mater. Sir William Ramsay has been the recipient of almost every medal and honor conferred by scientific bodies. Educated at Glasgow and Tübingen, he became successively principal of University College, Bristol, and professor of chemistry at University College, London. He followed up the discovery of argon first by the detection of helium in the mineral clevite, and then his skilful investigations, assisted by Dr. Travers, resulted in the detection of three new gases in our atmosphere—krypton, meon and xenon—the experimental work leading to these results ranking with the most refined ever carried out. Recently Sir William and Mr. Soddy have demonstrated that the ultimate residue of the disintegration of radium is helium.

This is the kind of work the world can well afford to honor. More of it is being done in this country, year by year, at the great universities and through the agency of such bodies as that most promising foundation, the Carnegie Institution. It will not be long, we confidently predict, before a greater proportion of the discoveries in pure science will be credited to the United States.

Extensive Traction Project in Ohio.

The Cleveland correspondent of the Western Electrician writes that, from present prospects, Ohio will shortly have an extensive traction system which may also connect with the systems operating out of Indianapolis. A few days ago the Northern Traction Company was incorporated with a capital stock of $500,000 by the interests back of the Cincinnati, Dayton and Toledo Traction Company, and the general understanding is that this is a holding company that will lease the latter. It is further said that the Elkins-Widener syndicate of Philadelphia is the controlling interest in the new company, and that its plan includes the connection of Cincinnati, Cleveland, Toledo and Indianapolis with traction lines. Following the supposition further, the western Ohio lines will become a portion of the system, either by purchase, lease or traffic arrangement, and the Dayton and Piqua will be acquired in a similar manner. This would give the company a line from Cincinnati to Lima, with a branch to St. Marys. Arrangements have been made by the Western Ohio to extend its line north to Findlay. The Toledo, Bowling Green and Southern has a line in operation from Findlay into Toledo, which would give a through line from Cincinnati to Toledo. From Lima to Findlay, the distance is 31 miles, and it is said that so much has been done that the additional cost will not exceed $15,000 a mile.

It is said that W. Kelsey Schoepf of Cincinnati and Hugh J. McGowan of Indianapolis are looking after the interests of the eastern capitalists in the deal. The terms of the lease of the Cincinnati, Dayton and Toledo have been given out and the proposition is satisfactory, considering the fact that the company has not yet paid dividends. The company is also to turn over $1,500,000 treasury stock and the same amount in bonds, and in return the new company agrees to spend not less than $1,500,000 in improvements and extensions the first two years. This will give the required power and the additional facilities that are needed.

More Long-distance Wireless.

The following interesting notes are sent from St. Louis by the American De Forest Wireless Telegraph Company:

"Some very remarkable distances have recently been covered by some of the De Forest wireless-telegraph installations. The operators at Buffalo and also at Cleveland, Ohio, have read a large number of messages sent from the two-kilowatt station mounted upon the roof at 42 Broadway, New York city. This station is equipped with only a 100-foot mast, and this distance of 700 miles overland from a two-kilowatt station is considered very remarkable. From this same station messages have been read on board the Mallory Line boats, Denver and San Jacinto, when less than 200 miles from Key West, Fla., or in the neighborhood of 900 miles from New York city. These two ships are each equipped with one-kilowatt apparatus, but they have been able to communicate over 350 miles. The De Forest Cape Hatteras station has in fact read messages from the Denver when she was only 50 miles out from New York city.

"In the work from 42 Broadway to Buffalo and Cleveland it was noticed that signals were much more distant at night than during the day. This is another evidence of the impairing effect on the transmission which the daylight exerts and which has only been noticed in one or two instances heretofore.

"In explanation of the extreme distances which have been attained from the two-kilowatt station at New York, it is suggested that the location of this station, some 350 feet above earth on the top of a steel building, plays an important part in this unexpected phenomenon. The source of the electrical waves here is at an unprecedented height from the earth and at the same time an excellent ground is afforded through the steel frame of the building."

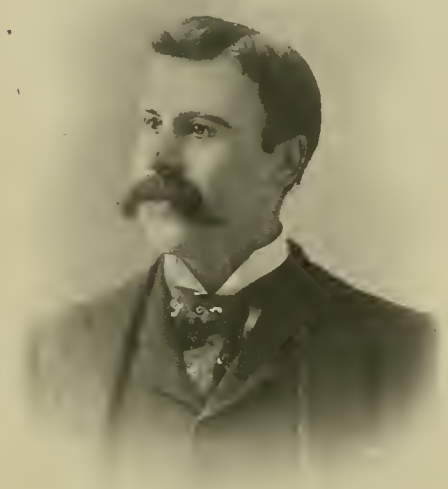
Electrical Industry in Chemnitz.

The first half of the year ended June 30, 1904, left the electrical machine manufacturing industry in Chemnitz, Germany, but moderately employed, but during the last six months conditions have improved steadily, so that at the present time this industry is fully employed. The Saxon electrical industry is especially highly developed, and Saxon motors, generators and transformers have acquired an excellent reputation for durability and cheapness. The Saxon government placed a number of heavy orders for electrical machinery that contributed much toward the improvement of conditions. Foreign markets also expanded satisfactorily. The heaviest foreign buyers were Holland, Belgium, Spain, South Africa, Russia, Austria-Hungary and the Balkan States. Though prices were kept down by severe competition, the demand continued good to the close of the year. Wage conditions are reported good in this branch. These facts are from a report of United States Consul Monaghan.

W. Forman Collins.

It is a trying task to set forth in cold type a brief chronicle of the characteristics and career of a friend and associate who but yesterday was in the harness of active work at one's side and who passed away as suddenly as the flame of a candle is snuffed out. It is the sad duty of the Western Electrician to attempt to do this in the case of Mr. W. Forman Collins, its vice-president and business manager, whose very sudden and unexpected death was briefly announced last week.

Mr. Collins' death was due to apoplexy, and it happened about 8 a. m. on December 21st. For many years—in fact from boyhood—he was subject to an unusual nervous ailment which manifested itself periodically in severe attacks resembling vertigo. In the intervals between these attacks (which of late years had been somewhat less frequent) Mr. Collins enjoyed apparent good health and pursued his vocations. He was at the office as usual the day before he died and conversed cheerfully with



W. FORMAN COLLINS.

his associates. He passed the evening at home and retired at his accustomed hour. In the morning he remarked to Mrs. Collins before arising that he had enjoyed a good night's sleep. He chatted pleasantly with his wife and was sitting in bed preparing to get up, when suddenly, with a slight noise in the throat, he pitched forward into his wife's arms—dead. Physicians were hurriedly summoned, but they could do nothing. Death had been instantaneous.

W. Forman Collins was born on September 14, 1867, and was therefore but 37 years of age. He was a native of Suffolk, England, and sprang from well-connected and well-to-do people. His father was a prominent lawyer who had attained the distinction of a Q. C., but he died while the subject of this sketch was but a child. Mr. Collins' mother died after he came to America. Quite early in life "Wilkie," as he was known to intimate friends—although the W. in his name really stood for William—was destined for a physician, and he was sent to Edinburgh to study for that profession. But the bent of his mind was toward electrical and mechanical problems, and accordingly the plan was changed and he was given a thorough technical training at an engineering school.

Mr. Collins was a bright, precocious young man, and he was still far from having attained his majority, when, in 1885, he came to the United States, which country was afterward his home. He immediately engaged in electrical pursuits, generally in New York, but for a while in Boston. For some time he represented the Callender underground cable interests, but later he did work in the line of electrical engineering and machine design. He designed several direct-current motors, and the Waddell-Entz and Crocker-Wheeler machines of the late '80's and early '90's bore evidence of his work.

About 1889 Mr. Collins became interested in electrical journalism, first on the editorial and then on the business side. He was connected with the Electrical World and later with the Electrical Engineer. In 1890 he came to Chicago to represent the latter journal in a business capacity. In this work he was successful, and two years later he purchased a large interest in the Western Electrician, becoming vice-president and business manager of the Electrician Publishing Company—a position he held until the time of his death.

In 1889 Mr. Collins married Mrs. Jessica Bill, a lady of great strength and beauty of character, who survives him. There are no children. He and his wife were devoted to each other, and their home life was ideal. In 1896-97 they spent a year in foreign travel for the benefit of the husband's health, visiting at that time relatives of Mr. Collins in London, where he is survived by three brothers and a sister.

Mr. Collins was a man of high character and lofty aims. He was a consistent churchman, charitable to the unfortunate, both in speech and in purse; he was kind and considerate to all men—a thoroughly good man. In business his judgment was sound, and he stood only for the best and cleanest methods; his integrity was unassailable. He was very domestic in his tastes and the inseparable companion of his beloved wife. He delighted in music and greatly enjoyed outdoor life, particularly yachting and driving. His great liking for machinery and mechanical processes of magnitude was always a characteristic. In early life he had been, too, something of an athlete. Mr. Collins had all of an Englishman's reserve, and seldom discussed his own affairs or the deeper feelings of his nature. But all who came to know him intimately recognized the sterling worth of his character, and, like his associates on the Western Electrician, feel an abiding grief at his untimely death.

The funeral took place on December 23d. Brief services were held at the house, 5344 Greenwood Avenue, and then the procession took its way to Trinity Reformed Episcopal Church, of which Mr. Collins was a member. The Rev. B. R. Thornbury, the dead man's pastor, officiated and made a brief address. Among the musical selections was one by Mr. Holmes Cowper, the well-known tenor, who arose from a sick bed to sing at the funeral of his friend. There were a number of floral remembrances, and among the people in the church were not a few electrical men. The bearers were Charles R. Mack, S. Arnold, A. Grossmith, E. J. Bardwell, Fred J. Lee, Frank L. Perry, C. W. Forbrich and N. F. Obright. The remains were taken to Albany, N. Y., for burial.

Since Mr. Collins' death a number of letters of condolence have been received, and these are much appreciated, both by Mrs. Collins and by the Western Electrician.

Electric Fans to Increase Efficiency of Radiators and Registers.

A new use for the electric fan, which serves as a cooling agent in the summer, is to bring about a diametrically opposite effect in the winter, that is, to increase the efficiency of a steam radiator. As described in The Electric City, this is done by setting the fan where it can blow against the radiator. By forcing a draft against the radiator much more heat is conducted away from the surface than if the radiator were surrounded by a layer of still air. The condensation of the steam in the radiator, being more rapid, the pressure need not be so high.

Another way the fan may be used is in distributing the air more quickly from a furnace register. Where the pipes are long and there are many bends there is often difficulty in getting the hot air from the furnace to pass to the upper floors before its heat is dissipated. A plan proposed is to build a sort of hood over the register which will contain the fan and direct the flow of air out into the room. When the fan is set in motion the increased draft soon draws sufficient air up the pipes to make the room warm.

Directors for Chicago Freight-tunnel System.

Announcement has been made that the following-named men will be among the directors of the Illinois Tunnel Company, which will operate the underground-freight project of the recently organized Chicago Subway Company: A. J. Earling, president St. Paul railway; E. P. Ripley, president Santa Fe railway; George H. Harris, president Burlington railway; S. M. Felton, president Chicago and Alton railway; J. Kruttschnitt, director of maintenance of ways, Southern Pacific and Union Pacific railways; B. L. Winchell, president Rock Island railway; A. C. Bird, vice-president Gould lines; F. D. Underwood, president Erie railway; Benjamin Thomas, president Chicago and Western Indiana railway; P. A. Valentine, vice-president Armour & Co.; Albert G. Wheeler, president Illinois Tunnel Company. Besides these there will be included in the directorate representatives of the Vanderbilt lines, the Pennsylvania and the Northwestern railways.

The Maximum Distance to Which Power Can Be Economically Transmitted.[1]

By Ralph D. Mershon.

It appears that all the elements in the annual cost per kilowatt for transmitting power, except those dependent upon the line conductors, may be continually reduced by increasing the amount of power to be transmitted. The annual cost per kilowatt due to the line conductors cannot be so reduced. It can be diminished only by such other means as will reduce the first cost of the conductors. As the first cost of the line conductors can be reduced only by increasing the voltage of transmission and as there is a limit to which such increase can be carried, it follows that the limiting distance to which power can be economically transmitted will depend, finally, upon the cost of the line conductors and upon this alone.

It will somewhat simplify the treatment of the subject if the interest charge be included as a part of the cost of transmission and profits be represented by a percentage on the investment. This course will, therefore, be pursued. That is, it will be assumed that in the cost of transmission is included the interest on the investment (bond interest) and that over and above this cost there must be earned a certain percentage, which percentage will represent profits (stock dividends). In addition the following assumptions will be made:

Power purchased at low-tension bus bars of step-up transformers and sold at outgoing bus bars of the step-down station.

Frequency of transmission not less than 25 cycles nor more than 30 cycles.

Idle synchronous motors at stepdown station to correct for power-factor, the average power-factor of the line being held as near unity as possible.

That no matter what the capacity of the plant, there will be three transmission lines, each capable of carrying one-third the load.

That the power-factor of the load supplied will be 0.8.

That no matter what the size of the plant the number of transforming units at each end of the line be 18, each transformer being normally worked at five-sixths of its rated capacity, so that one bank of three may be cut out, if need be.

That no matter what the size of the plant the number of corrective synchronous motors will be six, each being worked at five-sixths of its rated capacity. The kilovolt-ampere capacity of these synchronous motors must, for a load power-factor of 0.8, be equal to three-quarters of the kilowatt capacity of the load carried by the plant.

It is evident that the number of units must be considered as the same for plants of all capacities in order to take full advantage of the decrease of cost per kilowatt, due to increase of capacity.

The pole lines will be assumed as constructed with 12 steel towers to the mile.

Ideal conditions will be assumed throughout consistent with delivering reliable and cheap power. Since the object is to determine the maximum distance, the factors fixing commercial costs of apparatus will be taken at the lowest values likely to obtain.

Later on in this paper general equations are

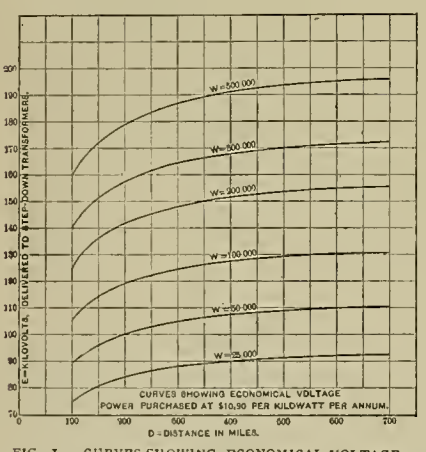


FIG. 1. CURVES SHOWING ECONOMICAL VOLTAGE.

derived expressing the relations between the distance of transmission and the qualities which govern it. By making assumptions, in addition to those mentioned above, as to the values of the various coefficients in the general equations and as to the purchase price and selling price of power, the curves of Figs. 1, 2, 3, 4 and 5 have been obtained, which are given and discussed here instead of at the end of the paper.

Fig. 1 shows the relation between the distances of transmission (D) and the economical voltage (E) for different kilowatt outputs (W); that is, it shows the voltage which it is most economical to use for any given output and distance of transmission.

1. Abstract of a paper presented at the meeting of the American Institute of Electrical Engineers, New York, December 23, 1904. Mr. Mershon is a well-known consulting engineer of New York.

Fig. 2 shows, in a corresponding manner, the economical drop.

Fig. 3 shows the diameter of the conductors corresponding to the conditions of Figs. 1 and 2.

Fig. 4 shows the relation between (D) the distance of transmission and (p) a percentage net profit on the investment for different values of output (W) and for selling price of $34 per kilowatt per annum.

Fig. 5 is a curve obtained from Fig. 4 and shows the relation between the distance of transmission and the output for a net profit of 12 per cent.

In obtaining these curves the constants have all been given values favorable to long-transmission distances. The costs have been taken lower than those ordinarily current in the endeavor to anticipate somewhat possible future prices. Also, the cost of power purchased at the step-up station has been fixed at the very low figure of $10.90 per kilowatt per annum.

The maximum amount of power dealt with herein, 500,000 kilowatts, is probably too high to be seriously considered at this time, but from 200,000 to 300,000 kilowatts is believed to be within the range of immediate future possibility. In a plant of this size it is probable that a net return of 12 per cent. would be required, not alone for the purpose of dividends, but also as a protection to the bonds. Under these conditions Fig. 5 shows the distance of transmission to vary from 512 miles for 200,000 kilowatts to 623 miles for 300,000 kilowatts. For the present outlook, therefore, the limiting distance may be taken as about 550 miles.

It appears from the preceding matter that under the conditions assumed the limiting distance of transmission will, for some time at least, be in the neighborhood of 550 miles.

It also appears that voltage limits will be fixed

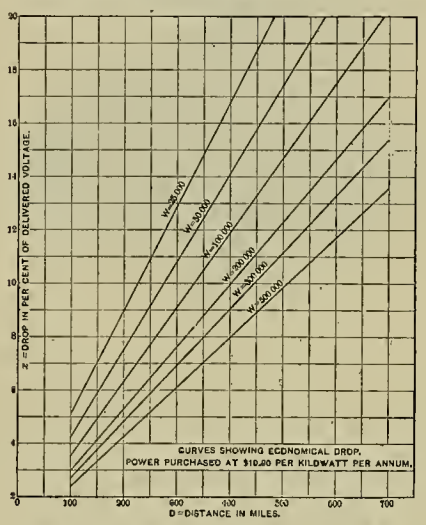

FIG. 2. CURVES SHOWING ECONOMICAL DROP.

not by conditions depending upon atmospheric losses, but by economic conditions.

The latter conclusion, while recognized as a possibility when this paper was begun, was unexpected. It is, perhaps, of greater present importance than the original object of the paper as conveyed in the title.

The analysis on which depends the general equations from which the preceding curves were obtained will now be taken up.

Let E = voltage, in kilovolts, delivered to step-down transformers.
D = distance of transmission in miles.
x = percentage of power lost in the line in terms of delivered power.
e = efficiency of the whole system.
e_1 = combined efficiency of step-up and step-down transformers and synchronous motors.
d = diameter of line conductors in inches.
W = power, in kilowatts, delivered at low-voltage bus bars of step-down station.
c = cost, in dollars per kilowatt per annum of power purchased at the low-voltage bus bars of the step-up transformers.
Let s = price, in dollars, received for power per kilowatt per annum at the low-voltage bus bars of the step-down station.
h = a quantity which, multiplied by c, will give the cost at the high-voltage terminals of step-up transformers.
R = total interest maintenance and depreciation charge per annum.
L = cost of labor for operating transformer stations and for executive and clerical services.
M = total investment.
C = total cost per annum of power delivered, inclusive of interest.
p = a percentage covering profit.

$\therefore e = \frac{e_1}{1+x}$, since $\frac{1}{1+x}$ is the efficiency of the line.

$\frac{W c}{e} = \frac{W c (1+x)}{e_1}$ = total amount expended per annum for power purchased.

$\therefore W s$ = total amount received per annum for power.

$\therefore C = \frac{W c}{e} + L + R.$

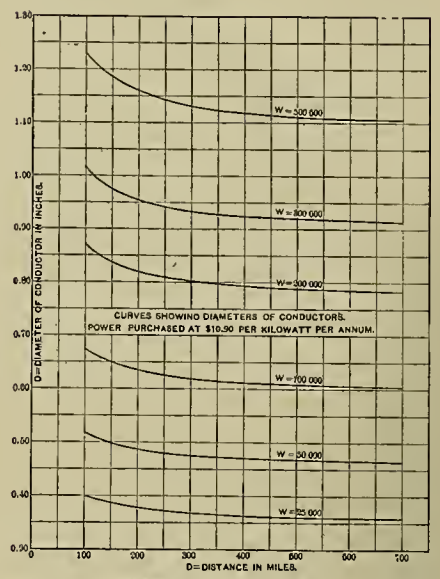

FIG. 3. CURVES SHOWING DIAMETERS OF CONDUCTORS FOR VARIOUS DISTANCES.

$$\therefore p = \frac{W s - C}{M} = \frac{W s - \frac{W c}{e} - L - R}{M} =$$

$$\frac{W s - \frac{W c (1+x)}{e_1} - L - R}{M} = \frac{N}{M} \qquad (1)$$

Now M is made up of
(1) Cost of transformers.
(2) Cost of transformer switchboard apparatus, cables, lightning protection, etc.
(3) Cost of building and real estate.
(4) Cost of insulators.
(5) Cost of pole-line material and construction.
(6) Cost of right-of-way.
(7) Cost of corrective synchronous motors and exciters.
(8) Cost of switchboard apparatus, cables, etc., for synchronous motors.
(9) Cost of line conductors.

Cost of transformers will depend upon voltage and output;
f_1 (E, W).

Cost of transformer cables and controlling apparatus will depend upon same quantities as transformers, but in a different way;
f_2 (E, W).

Cost of building will depend upon output;
f_3 (W).

Cost of insulators will depend upon voltage, diameter of conductors and number required, i. e., voltage, diameter of conductor and distance of transmission;
f_4 (E, d, D).

Cost of pole-line construction will depend upon diameter of the conductors and the distance. But the diameter of the conductors depends upon voltage, drop, output and distance; hence,
f_5 (d, D) = f_5 (E, W, x, D).

Cost of right-of-way will depend upon distance only;
f_6 (D).

Cost of synchronous motors will depend upon output only, since all other elements affecting cost will be fixed;
f_7 (W).

Cost of switchboards and cables for synchronous motors will depend upon output only;
f_8 (W).

Cost of line conductors will depend upon voltage, output, line loss allowed and distance of transmission;
f_9 (E, W, x, D).

The sum of these nine functions constitutes M, the total investment.

Now R, the total interest and depreciation charge, depends upon all of the several quantities making up M.

In what follows the numerical value of the constants are those taken for the specific problem treated herein.

Let p_1 = 0.125, being the percentage of transformer cost for interest, depreciation and repairs.
p_2 = 0.125, being the percentage of transformer switchboards cost, for interest, depreciations and repairs.
p_3 = 0.075, being the percentage of buildings, cost for interest, depreciation and repairs.
p_4 = 0.10, being the percentage of insulator cost for interest, depreciation and repairs.

$p_5 = 0.125$, being the percentage of pole-line cost for interest, depreciation and repairs.
$p_6 = 0.05$, being the percentage of cost of right-of-way, for interest only.
$p_7 = 0.125$, being the percentage of synchronous-motor cost for interest, depreciation and repairs.
$p_8 = 0.125$, being the percentage of cost of synchronous-motor, switchboard, etc., for interest, depreciation and repairs.
$p_9 = 0.05$, being the percentage of cost of conductors, for interest.
R = the sum of these percentages multiplied respectively into the several quantities to which they refer.
L depends only upon output $f_{10}(W)$.

Let q = that portion of the cost per kilowatt at the low-tension bus bars of the step-down station, which is due to line loss and to interest on the value of the conductors; then, anticipating in part the matter further on

$$q = \frac{p_9 K_9 \frac{W D^2}{E^2 x} - hc\,Wx}{W}$$

in which $p_9 K_9 \frac{W D^2}{E^2 x}$ is the interest on the conductors and hc Wx the cost of the power lost in the line.

Setting the first derivative of this with respect to x equal to zero, in order to determine the value of x corresponding to the minimum value of q, we find the well-known expression for economic drop

$$x = \left(\frac{p_9 K_9}{hc}\right)^{\frac{1}{2}} \frac{D}{E} = n\frac{D}{E} = 0.038\frac{D}{E} \qquad (2)$$

From this equation for x we may obtain the equation

$$\frac{D^2}{E^2 x} = \frac{hcx}{p_9 K_9}$$

Let q_1 = that portion of the annual cost per kilowatt of delivered power due to the line loss, conductors, insulators and transformers. It has just been shown that for best economy the line loss and annual-conductor cost must be equal, so that twice the line loss, 2 hc Wx, may be taken as representing the sum of the annual cost due to line loss and to the conductors.

The cost of insulators will vary as the distance of transmission, and as the cube of the voltage. The cost of the transformers may be represented by

$$K_1'(E + K_1'')\,W^{\frac{1}{2}}$$

Hence remembering that p_1 and p_4 are the interest

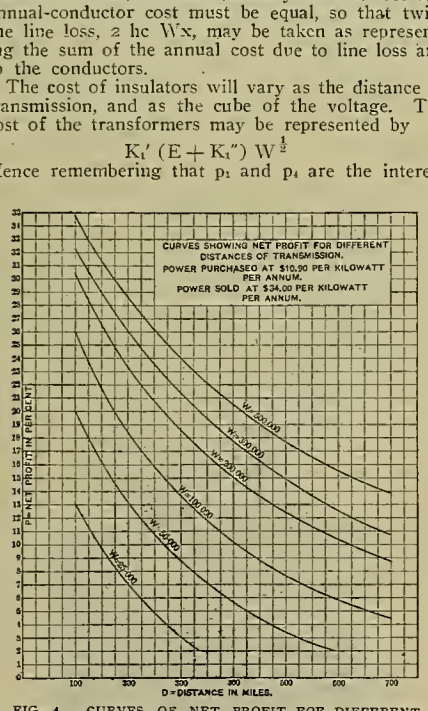

FIG. 4. CURVES OF NET PROFIT FOR DIFFERENT DISTANCES.

and depreciation of transformers and insulators, respectively.

$$q_1 = \frac{2\,hc\,Wx + p_4 K_4 E^2 (1+x)^3 D + p_1 K_1'(E + K_1'')\,W^{\frac{1}{2}}}{W}$$

or, putting in the value of $x = \left(\frac{p_9 K_9}{hc}\right)^{\frac{1}{2}} \frac{D}{E} = n\frac{D}{E}$,

$$q_1 = [\,2\,h\,n\,WDE^{-1} + p_4 K_4 E^2 (1 + n\,D\,E^{-1})^3 D + p_1 K_1'(E + K_1'')\,W^{\frac{1}{2}}\,] \div W$$

It will greatly simplify matters if instead of substituting the value of x in $(1+x)^3$ we substitute for x, x_1, a fixed drop of such value as will correspond to the average cost of insulator between the two extreme values of x which will be met with in practice; the error due to such a course will be small. Hence

$$q_1 = [\,2\,h\,c\,n\,W\,D\,E^{-1} + p_4 K_4 E^2 (1+x_1)^2 D + p_1 K_1'(E + K_1'')\,W^{\frac{1}{2}}\,] \div W$$

Setting the first derivative of this equation equal to zero, solving and substituting the value $n = \left(\frac{p_9 K_9}{hc}\right)^{\frac{1}{2}}$ there results

$$E = \left(\frac{-\,p_1 K_1'\,W^{\frac{1}{2}}}{6\,p_4 K_4 (1+x_1)^3\,D} + \sqrt{\frac{p_1^2 K_1'^2\,W}{36\,p_4^2 K_4^2 (1+x_1)^6 D^2} + \frac{2\,(hcp_9 K_9)^{\frac{1}{2}}\,W}{3\,p_4 K_4 (1+x_1)^3}}\right)^{\frac{1}{2}}$$

$$= \left(-3066\frac{W^{\frac{1}{2}}}{D} + \sqrt{9400356\frac{W}{D^2} + 3438.5\,W}\right)^{\frac{1}{2}} \qquad (3)$$

This shows that the voltage may be increased with increase of output, which was to be expected since those costs which limit the voltage will diminish in their amount per kilowatt as the output increases.

In Fig. 1 are shown curves plotted from equation (3). These curves show the kilovolts (E) for different distances (D), and different outputs (W).

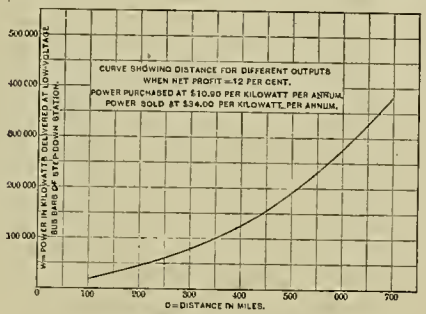

FIG. 5. CURVE OF DISTANCES FOR VARYING OUTPUTS, 12 PER CENT NET PROFIT.

Fig. 2 gives curves plotted from equation (2), using the values obtained from the curves of Fig. 1. The curves of Fig. 2 show the percentage drop (x) for different distances (D) and different outputs (W). In Fig. 3 are curves showing the diameters of the conductors for the conditions of Figs. 1 and 2. These diameters were calculated from the formula

$$d = k_5'\left(\frac{W\,D}{E^2 x}\right)^{\frac{1}{2}} = k_5'\left(\frac{W\,D\,E}{E^2\,n\,D}\right)^{\frac{1}{2}} = \frac{k_5'}{n^{\frac{1}{2}}}\left(\frac{W}{E}\right)^{\frac{1}{2}}$$

$$= 0.0219\left(\frac{W}{E}\right)^{\frac{1}{2}} \qquad (4)$$

which gives the diameter (d), in inches, of a solid conductor.

From a careful consideration of transformer prices it has been determined that for transformers of 1,500 kilowatts and over the cost installed very closely follows the law.

$$f_1(E, W) = K_1'(E + K_1'')\,W^{\frac{1}{2}} =$$
$$13\,(E + K_1'')\,W^{\frac{1}{2}} \therefore p_1 f_1(E, W) =$$
$$p_1 K_1'(E + K_1'')\,W^{\frac{1}{2}} = 1.625\,(E + K_1'')\,W^{\frac{1}{2}}$$

in which K_1' is a constant and K_1'' a "variable constant," a quantity which varies slowly with the output in accordance with the law,

$$K_1'' = k_1 + k_1''\,W = 55 + 0.000227\,W$$

The apparatus for the control of transformers may be considered as depending only upon output. Under this assumption a consideration of costs of transformer-controlling apparatus and cables shows that we may assume with a close degree of accuracy that

$$f_2(E, W) = K_2' + K_2''\,W = 21\,000 + 0.9\,W$$
$$\therefore p_2 f_2(E, W) = p_2 K_2' + p_2 K_2''\,W = 2625 + 0.1125\,W$$

The cost of buildings and the real estate for them will increase very slowly with the output. The variation of this item, due to variation of output, can be expressed closely enough by

$$f_3(W) = K_3' + K_3''\,W^{\frac{1}{2}} = 125\,000 + 125\,W^{\frac{1}{2}}$$
$$\therefore p_3 f_3(W) = p_3 K_3' + p_3 K_3''\,W^{\frac{1}{2}} = 9375 + 9.375\,W^{\frac{1}{2}}$$

The cost of the pole-line material and construction will depend somewhat upon the diameter of the conductors, since, as the diameter of the conductors increases, the wind and sleet stresses will increase. The increase of cost with increase in diameter of conductors will be slow. The law followed will be that of a constant plus a function of the diameter of conductors, since, no matter how small the diameter of conductor, there will be a certain cost representing the minimum-sized pole which would be employed. We may with a fair degree of accuracy, write

$$p_5 f_5(E\,W\,x\,D) = 375\,D + 4.65\left(\frac{W}{E}\right)^{\frac{1}{2}} D$$

which answers for a stranded conductor.

Cost of right-of-way will be directly proportional to distance, hence

$$f_6(D) = K_6 D = 1000\,D$$
$$\therefore p_6 f_6(D) = p_6 K_6 D = 50\,D$$

A consideration of synchronous-motor prices shows that the cost of synchronous motors may be written,

$$f_7(W) = K_7' + K_7''\,W = 12\,000 + 32.4\,W$$
$$\therefore p_7 f_7(W) = p_7 K_7' + p_7 K_7''\,W = 1500 + 4.05\,W$$

The switchboards and cables for the motors will follow the same law as those for the transformers

The cost of labor for the operation of the step-up and step-down transformer stations and for executive and clerical purposes would probably not vary at all We have in each case the same number of units to be looked after, and the size of these units would make little if any difference in the cost of attendance upon them Similarly, the output will make little difference in executive and clerical costs.

The efficiency of the whole system is $\frac{c_1}{1+x}$

Putting in the value of $x = n\frac{D}{E}$

$$e = \frac{e_1}{1 + n\frac{D}{E}} = \frac{0.925}{1 + 0.038\frac{D}{E}}$$

$$\frac{W\,c}{e} = \frac{W\left(1 + n\frac{D}{E}\right)c}{e_1} = \frac{W\,c}{e_1} + \frac{n\,c}{e_1}\cdot\frac{W\,D}{E} = 11.78\,W + 0.448\frac{W\,D}{E}$$

The various functions above arrived at may now be utilized in obtaining N and M of equation (1), $p = \frac{N}{M}$

Remembering that R is the sum of the products of the various functions by the corresponding percentages representing interest, depreciation and repair; that $L = f_{10}(W)$, and representing the various resulting collections of constants as follows:

$a = p_2 K_2'' + p_1 K_7'' + p_8 K_8'' = 4.184$
$b = K_{10}' + p_2 K_2' + p_3 K_3' + p_7 K_7' + p_8 K_8' = 46\,550$
$m = K_{10}'' + p_2 K_2'' = 35.38$
$r = p_5 K_5' + p_6 K_6 = 425$

$$\text{then } N = W\,s - \frac{W\,c\,(1+x)}{e_1} - L - R$$
$$= \left(s - \frac{c}{e_1} - a\right)W - \left(\frac{n\,c}{e_1} + \frac{p_9 K_9}{n}\right)\frac{W\,D}{E} - m\,W^{\frac{1}{2}} - p_1 K_1'(E + K_1'')\,W^{\frac{1}{2}}$$
$$- p_4 K_4 (1+x_1)^3 E^2 D - r\,D - \frac{p_5 K_5'' k_5}{n^{\frac{1}{2}}}\left(\frac{W}{E}\right)^{\frac{1}{2}} D - b.$$

Representing constants as follows:

$\alpha = K_2'' + K_7'' + K_8'' = 33.47$
$\beta = K_2' + K_3' + K_7' + K_8' = 166{,}400$
$\gamma = K_5' + K_6 = 4{,}000$

$$M = \alpha\,W + \frac{K_9\,W\,D}{n\,E} + K_2''\,W^{\frac{1}{2}} + K_1'(E + K_1'')\,W^{\frac{1}{2}} + K_4(1+x_1)^2 E^2 D + \gamma\,D + \frac{K_5'' k_5}{n^{\frac{1}{2}}}\left(\frac{W}{E}\right)^{\frac{1}{2}} D + \beta.$$

These values of N and M, if substituted in equation (1), will give, in its final form, the equation connecting distance, output, voltage, and profit, or, in connection with equation (3), for voltage, the relation between distance, output and profit. Such substitution results in a cumbersome equation, and will not be made here. If the various numerical values, already determined for the specific problem herein treated, be substituted in N and M, there results,

$$N = (s - 15.96)\,W - 0.903\frac{W\,D}{E} - 35.38\,W^{\frac{1}{2}} - 1.625\,(E + K_1'')\,W^{\frac{1}{2}} - 0.0000883\,E^2 D - 425\,D - 4.65\left(\frac{W}{E}\right)^{\frac{1}{2}} D - 46550$$

$$M = 33.47\,W + 9.1\frac{W\,D}{E} + 125\,W^{\frac{1}{2}} + 13\,(E + K_1'')\,W^{\frac{1}{2}} + 0.0000883\,E^2 D + 4000\,D + 37.2\left(\frac{W}{E}\right)^{\frac{1}{2}} D + 166\,400.$$

The value of s in the above equation for N is taken as 34, that is, it is assumed, for the purposes of the specific problem, that power is sold at $34 per kilowatt. Putting in this value of s and calculating the value of p for different outputs, W, and different distances, D, the curves of Fig. 4 have been obtained. These curves show, for different values of W, the relation between p and D. Assuming that the minimum acceptable profit is 12 per cent., and taking from Fig. 4 the values of D and W corresponding to this percentage profit, there has been plotted the final curve, Fig. 5, which shows the relation between distance and output.

Discussion (in Abstract).

H. G. Stott, New York city: This paper deals with figures of 200,000 or 300,000 kilowatts, and the distances mentioned as being possible are 550 miles. The transmission of power from Niagara Falls to New York would come well within the limits defined by Mr. Mershon, as the distance is approximately 450 miles, and the amount of power used by the large plants in this city approximates 175,000 kilowatts, or in that neighborhood. In connection with the load, another point occurs to me—is it the right way to discuss costs in kilowatts per annum? The writer says a kilowatt per annum, 8,760 hours per year, and the greater part of the load is known as peak load. I therefore contend that no formula of expression which does not take into account the load factor fully expresses the situation. The value which Mr. Mershon gives of $34 per kilowatt would mean that,

on a one-hour peak load, it would pay him a little over 11 cents per kilowatt-hour. I do not think any steam plant costs as much as that. Another point, at the other end of the line is the figure of $10.90 per annum per kilowatt. I believe there are very few water plants that can be constructed for less than $100 per kilowatt. I doubt if there are any constructed at that price, and, assuming Mr. Mershon's figures of 12.5 per cent. interest, depreciation and maintenance, that would be $12.50 to be charged against the cost of power. Many endeavors have been made to charge for a kilowatt per annum on that basis, but they have inevitably, it has been my experience, ended in a mutual recognition by the company supplying the power and the company buying it that it was not fair. It is quite a good arrangement for the company selling the power, but not the company buying it, because under this price of $34 per year per kilowatt, it amounts to 11 cents per kilowatt for one hour. There are few plants that can operate with a better load factor than 50 per cent., and I figure for the average plant, railway or lighting, that would bring up the average cost of power to about 0.8 of a cent per kilowatt-hour.

Philip Torchio, New York city: The general problem treated by Mr. Mershon in his valuable paper involves the study of the two main factors which enter into the problem of power transmission, i. e., the transmission voltage and the cross-section of the conductors. The elements which are affected by the voltage are the cost of transformers and insulators, which increase with the voltage, and the cost of line conductors and line losses, which decrease with the voltage. All the other elements are practically not influenced by the change in voltage. Mr. Mershon has treated the subject in detail, and has given a formula for the determination of the most economical transmission voltage. In this formula enters the cost of line losses and interest and depreciation on conductors, both of which are dependent upon the most economical cross-section of conductors; therefore the dominating factor in a study of this character is the determination of the cross-section of conductors for the fixed conditions of each problem.

Mr. Mershon has adopted the Kelvin law for the determination of the cross-section of conductors, and he has obtained the results shown in Fig. 3, giving "the diameter of the conductors for power purchased at $10.90 per kilowatt per annum." I wish to make a criticism in connection with Mr. Mershon's assumption of $10.90 per annum for the line losses, this being the same amount as paid for the main bulk of current. Mr. Mershon in this instance failed to apply the very same principle which is one of the prominent features of the treatment of this paper, i. e., "That the greater the output of a plant the less is the cost per kilowatt of all the equipment." Now, if there is a case where this general principle is unquestionably correct, it is the case of the increment cost of station equipment for amounts not exceeding, say, five or 10 per cent. of the total equipment. That is, if a plant of 100,000 kilowatts will cost say $10,000,000 or $100 per kilowatt, we must certainly be able to increase the capacity of the apparatus say 10 per cent. at an increment cost considerably less than the average of $100 per kilowatt. The fact that in the paper the power is assumed to be purchased at a fixed rate per kilowatt will not alter conditions, as the saving derived from this increment cost of generating equipment will be felt either directly or indirectly by the transmitting company, either by lower fixed charges for the operation of the generating plant, or lower price of power, charged by the generating company. If the transmitting company owns and operates the generating plant as well, nobody will raise any question upon the above reasoning. I therefore do not see any reason why the same should not hold for the two enterprises operated independently; at least in this theoretical discussion such assumption should be made.

In making further criticism, I have in mind that this paper is of a pioneer character, and therefore should only be discussed upon broad lines. We must assume ideal conditions, and we must even allow something that may appear problematical at the present time.

Dr. A. E. Kennelly, Cambridge, Mass.: The limiting distance is stated to be 220 miles in the West at this time for the transmission of power, and even if we assume that 550 miles would be the commercial limit for a large block of power, something like 200,000 kilowatts, it would be found possible, no doubt, to add on another 500 miles, and carry 10 kilowatts, commercially, if some one would pay for it, and in that way the power might be carried 1,000 miles. The problem is so flexible it is necessary to limit it practically to obtaining a clearer definition of what we mean by selling power. It is noticeable that all the curves commence at the 100 miles, which is fortunate, as there are so few circuits extending over a hundred miles that we have not much chance of comparing them with the possibilities laid before us. The paper is interesting as far as it goes in showing that under these conditions which are assumed, certainly not the conditions of today, perhaps conditions never to be realized, but at all events under certain definite conditions, it would be possible to buy power at $10.00 and sell it at $34, at a distance of 500 miles. Curiously enough, that is the distance that telegraphers think that it is worth while to transmit their power, because when they get to distances greater than that they put in repeaters. Mr. Mershon's conclusions fall in nicely with the limiting distances generally acknowledged in telegraphic practice.

Charles F. Scott, Pittsburg, Pa.: This paper of Mr. Mershon's contains something more than simple mathematical gymnastics. The paper is really the outcome of several years of study of this problem in different ways. Mr. Mershon, as you know, did excellent work a number of years ago in determining experimentally in the West the action of high voltage on wires, and making determinations, under the conditions which prevailed in his experiments, of the actual losses taking place between wires. You will remember that the curves that he there found had very decided turning points in the neighborhood of 60,000 volts. As the voltage was slowly raised, the loss on the wire was so small it could hardly be measured, the current being so small at the high voltage. The instrumental and measuring difficulties were very great, but when about 60,000 volts was reached the curve took a decided turn and increased in voltage beyond that point; even a half per cent. would increase the loss considerably between the wires so that there was under these conditions a definite limit of about 60,000 volts. I commented upon this point before the Institute in a paper some six years ago, and the conclusion was drawn that under the present methods of transmitting power by overhead conductors the limit would be somewhere in the neighborhood of 60,000 volts, limits which would settle the limiting distance of transmission at something like 150 miles. The man who was rash enough at that time to set a definite limit in the matter of power transmission, following after the other engineers a few years ago, to whom Dr. Kennelly referred, has been sorry for it ever since, and he stands before you now. There was something overlooked, something that was not thought of, and that was the size and diameter of the wire; the diameter of the wire modifying these losses and causing them to occur only at higher voltages. The lesson, however, is one which we learned, and I think other men can profit from it—that it is pretty dangerous to draw conclusions on matters too far off in the future. Mr. Mershon has attacked the general problem rather from the commercial than the scientific side, and I imagine that the problem was one which enlarged as he worked upon it. The paper takes a good, general, broad view of the subject. At the International Electrical Congress there were many papers presented in the Transmission section by gentlemen in this country and abroad, but all the papers which were presented dealt with some specific and local thing; some detail, the method of operation, or the kind of insulation, or the method of stringing wires, the characteristics of aluminum and copper, etc. There was no broad paper presented. This paper was prepared by Mr. Mershon as a representative of the Institute, to be presented at the Congress, but the equations were too long and he did not get time to present it to the Congress, and he has presented it to us here tonight.

While there are objections to the misuse of data such as are given here, I think the paper would have relatively little interest and value if it simply had the equations and did not give certain definite results. I think the paper is valuable in giving certain results as being the legitimate outcome of certain results which are given. Of course, if these assumptions are varied the distance may go up and down, but it is a satisfaction to know, that under conditions which are fairly commercial, that the distance is about that from Niagara Falls to New York city and that the units of power are as here stated.

In considering this paper, the thought struck me that we are dealing with something outside of the range of things we are dealing with now. I imagine if we look at the wire tables of 10 years ago we would find the units then used for transmitting lights running up to a few hundred, and then a little later running into a few thousand. This problem goes into hundreds of thousands. These curves pay very little attention to units less than 50,000 horsepower, which is about the output of the largest stations which are now in operation. Many of the conditions here do not apply to less than 200,000 horsepower, which is about the amount of electrical power now used in New York city. This means that the field of power work which is here considered is one somewhat in the future—that our future developments, the size of our waterpower plants and the scale on which we may use power in the future, are far beyond that which we now have as our present practice, as the consumption of current at this day is beyond that of the early days of incandescent lighting. Another interesting thing I note are the curves of Fig. 2, which give the drop in per cent. of delivered voltage.

When we thought of high voltages, our thought was of a small wire, and when the voltages got from 1,000 to 2,000 and then to 10,000, the problem used to be to secure the smallest size of wire which would be mechanically strong enough to be put in place and maintain its position; and so with these larger units our size of wire has gotten so very large that we have again gotten into a new order of things, and Mr. Mershon's wires would about reach the present limit of mechanical construction in size. It has been sought to bring out the very remarkable thing that the size of this wire is so great that apparently the atmosphere losses, which awhile ago were thought to be the determining element, no longer determine the maximum voltage of transmission.

Mr. Mershon: In presenting the paper it seemed to me that others might derive, or imagine they derived, some similar benefit. The difference of opinion which has developed here tonight is no greater than I expected it would be. I do not suppose there are ever two engineers who estimate in exactly the same way on everything or whose estimates, if you would examine them in detail, would agree exactly. One would be higher on one item, lower on another, and in one the items would be simply reversed, as far as the cost was concerned. The estimates made by them as a whole might agree very closely, but in details they might be pretty far apart. On any proposition, in order to judge it as a whole you must consider it in detail, but if you consider it in detail you must consider the equalizing factors of those details. If the details agree, so much the better. If they do not, I do not think it is absolutely necessary they should agree, if the general result works out satisfactorily. I think, therefore, in the matter of the paper too much stress should not be paid on particular details, because you will find there will be differences of opinion among different engineers in regard to different items and different assumptions, and I think the average opinion, if you could get it, would come pretty close to the figures that are given in this paper. But suppose they do not; suppose they were far enough off so that the limiting distances given in the paper were even as great as 20 per cent. Even in that case I do not think the value of a general view of the subject would be diminished to a considerable extent. I feel that it would not be, from my standpoint, because I have now a broader grasp of the whole subject before undertaking the work. As Mr. Scott said, the paper presents more of interest if you have some definite figures than if you simply went through an analysis and left it hanging in the air. It was my endeavor to get some figures that would give an idea of the use of these quantities that I used in making the assumptions. What was desired was a general view of the whole subject of transmission in regard to the limits and possibilities, so that we might have a general guide in this matter.

Mr. Stott brought out a number of interesting questions. As to the cost of the generating plant, as represented in the price I assumed in the figure for cost of power, I will admit that is low; but I will not admit that it is not as low as it is done, or could be done. I do not feel free to say much more than that, but there are some waterpowers throughout the country where the price is very low, where the Lord has done a good deal of the work in developing the power, as was suggested here tonight; but aside from that, supposing the development would be along the lines we have had at Niagara Falls, in considering blocks of power as large as this, and as more power plants are installed, and more skill and experience is brought to bear upon them, I think the cost of power at Niagara Falls will be very considerably diminished from what it is now.

Novelties in Special Decorative Incandescent Lamps.

The accompanying cuts illustrate two of the latest novelties in special forms of the incandescent lamp that have just been placed on the market by the Sterling Electrical Manufacturing Company of Warren, Ohio. The Sterling company has for a long time done excellent work along the line of the creation of special miniature and decorative incandescent lamps, and doubtless the two specialties illustrated herewith will be welcomed as novelties by the many interested in decorative lighting work.

STAG'S HEAD NOVELTY INCANDESCENT LAMP.

The stag's head lamp shown is a realistic bit of

glasswork, as is demonstrated by the appearance of the antlers. The lamp is of frosted glass and is a "real burning" incandescent lamp. These stag's head lamps are equipped with either standard Edison base or candelabra base. They are arranged in voltages of 104, 110, 115, or, in fact, any normal voltage lamp may be obtained.

The pig lamp appears as in the picture, and is made in two sizes, one having candelabra socket and another having regular lamp socket; this lamp is made to fit an Edison socket.

To appreciate fully the merits of these little specialties, however, a sample should be inspected and the lamp lighted, as in actual service.

In addition to this and other curious specialties in miniature and decorative incandescent lamps, the Sterling Electrical Manufacturing Company makes a most complete and attractive line of candelabra

PIG NOVELTY INCANDESCENT LAMP.

lamps of various forms suitable for decorative work. The Sterling company also makes a line of automobile lamps particularly suitable for electric automobiles in that they are designed not to be injured by the jarring of the machine and the liability of fluctuations in the voltage, owing to the sudden changes in load and the consequent sudden draught on the battery of the automobile. In addition to the above-mentioned styles, the company likewise produces a line of regular battery lamps, high-efficiency battery lamps, and also telephone lamps for service in switchboards.

Transformer for Thawing Ice in Water Pipes.

A transformer for thawing ice in water pipes has been recently developed by the General Electric Company. This transformer is easily connected to alternating-current circuits, and has proved an immense advance over the old method of opening the frozen ground and applying fire externally, which

TRANSFORMER FOR THAWING ICE IN WATER PIPES.

was both inefficient and expensive. The transformer is shown in the accompanying picture.

The core has three horizontal legs, with a closed magnetic circuit at the ends. Flat pancake coils are threaded on the middle leg and spaced apart, so as to permit an adjustable flux shunt to move up and down between the primary and secondary coils. When the shunt is in the lowest position, it shunts the primary flux from the secondary coil, and in its highest position permits practically all the flux to thread the secondary coil. At intermediate positions, proportionate amounts of flux thread the secondary coil.

Leads from the primary coil are brought out to a suitable connection board on the side of the transformer, on which are mounted primary switches, fuses and ammeter. The terminals of the secondary coil are brought out to heavy lugs, from which cables can be run to the pipes to be thawed.

Complete, the outfit, including the transformer, switches, cover and ammeter, weighs approximately 1,200 pounds. If desired, it will be mounted on four broad flanged wheels to permit its being quickly loaded on a wagon bed or sleigh.

The transformer has the following desirable features deserving of special mention: It is light, compact, easy to handle and operate, is self-contained and free from oil, and readily lends itself to adjustments from zero to maximum secondary capacity without wasting energy in a dead resistance. It is liberally designed for its work. The large radiating surfaces of the core and coils and spacious air ducts insure cool operation under normal conditions.

While the secondary coil is rated at 75 volts and 400 amperes, a very much larger current may be taken from the transformer for temporary operation, especially in winter time. For instance, in starting up with the transformer cold on a winter's day it will be perfectly safe to take out 800 amperes for 10 or 15 minutes. Smaller currents can be taken out for correspondingly longer periods.

The transformer has been especially designed to meet all conditions which may ordinarily arise in practice. It can be successively applied from one operation to another with only sufficient intermission to transfer the connections, and can be used on any pipes of ordinary size and length not requiring an output more than equivalent to a continuous output of 30 kilowatts, or an intermittent output of 60 kilowatts.

The weight is small, considering the capacity of the transformer. The manufacturer offers smaller and lighter outfits where the conditions warrant their use. The General Electric Company has issued an attractive pamphlet describing this transformer, which will be sent on request.

Motor for Cranes and Hoists.

Motors designed for the operation of cranes, hoists and similar apparatus are manufactured extensively by the Westinghouse Electric and Manufacturing Company, and for intermittent service in which heavy starting torques and wide speed variation are required the new type-K is especially adapted. They represent the latest development and include the most recent improvements in machinery of this kind. Many new features of the highest practical value have been incorporated in their construction.

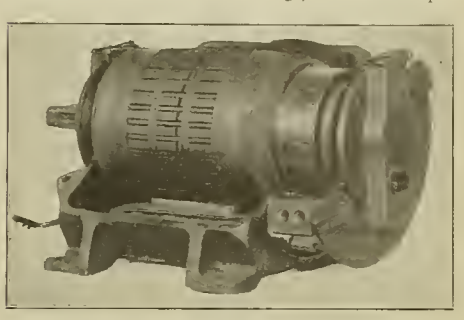
EXTERIOR OF ENCLOSED CRANE MOTOR.

They are strong and compact, convenient to install, adaptable to every practical form of mounting, and are reliable, economical and powerful in operation. Ten sizes are standard, including capacities from two to 40 horsepower. The accompanying illustrations show the motor as a whole and with the upper field removed. The frames are of the wholly enclosed form, to guard against dirt and moisture, but are so designed that the working parts may be exposed for inspection or adjustment without dismantling. If local conditions permit, the cover about the commutator may be removed and the motor operated open, with improved ventilation and increased capacity.

These motors have four inwardly projecting poles, each of which is magnetized by a separate field coil, which is superior to that in which but two poles are directly magnetized. They are series-wound and are designed for operation on direct-current circuits of 220 and 500 volts. Since the current passes successively through armature and field winding, the torque of such a motor increases nearly as the square of the current, up to the point of saturation of the iron. For this reason the series motor is particularly well suited to the starting and acceleration of heavy loads. Governed by change of voltage at the motor terminals, the speed of the motor is carried through a wide range, the change in the resistance of the motor circuit being made by means of a controller.

Cast steel is used for the frames (except in the three smallest sizes, where they are cast iron). They are extremely compact, nearly square in section and require the smallest possible amount of headroom on a crane, or floor space when used with hoists or similar apparatus. Two poles project inwardly in a horizontal and two in a perpendicular plane, this arrangement being the most compact possible with a four-pole motor. The frame is built in two parts, divided in a plane passing through the axis of the armature and at an angle of 34 degrees with the horizontal, an arrangement which allows the upper half of the field to be removed without disturbing the gears or shaft, and makes it easy to take out a pole piece and field coils, or to remove the armature. The lower half of the frame has four feet, with holes for bolting to the support, providing the smallest base consistent with good engineering practice. The lower casting has also two finished faces or pads, to which bearings for a countershaft may be bolted or which may be used for side mounting. The commutator end of the frame is connected to the poles by six ribs, any two of which may carry the brush holders. The opening around the commutator is entirely closed by a three thirty-seconds-inch sheet-steel band, fastened by thumb-screws, an arrangement which permits access to the commutator and brush holders at all points.

The four pole pieces are built up of soft steel punchings, riveted together, between wrought-iron end plates, and are secured to the frame by bolts which pass well into the punchings, but leave the pole



CRANE MOTOR WITH TOP HALF REMOVED.

face smooth and unbroken. The coils of the larger motors are of copper strap, and the terminals are insulated with asbestos ribbon.

Shells lined with bronze or babbitt and mounted in housings which may be removed without separating the motor frame, constitute bearings of particular merit and splendidly adapted to the service for which these motors have been designed.

The armature core is built up of soft steel punchings of high permeability, carefully annealed by a special process. These punchings are, in all except the smallest sizes, assembled on a spider and held from turning by a steel key. The pinion end is provided with a bell-shaped flange, which forms a support and shield for the armature coils. Ducts between the punchings are provided, through which air, drawn in through openings in the spider, is forced out against field coils and core, maintaining a uniform temperature throughout all parts of the motor. The commutator is mounted on the armature web, allowing the shaft to be removed without disturbing the winding or connections. The coils are placed in slots and retained by bands laid in grooves below the surface of the core, except in the case of armatures for the Nos. 9 and 10 motors, which have fish-paper wedges forced in between V-shaped grooves near the top of the slots. Covers of oiled duck adequately protect the ends of the winding. Wiper rings or oil guards are provided at each end of the armature to protect the winding from oil.

The commutator is built up of bars of hard-drawn copper, insulated by prepared mica, and mounted on the armature spider. The commutation is particularly good, in spite of the heavy rushes of current to which a motor of this class is subjected.

Brush holders are of the sliding type and possess many features of peculiar merit. The individual holders may be independently adjusted. Tension is provided by means of a coiled spring, which acts through a short brass strip, so that the spring responds immediately to any movement of the brush, and close contact is maintained at all times. The brush-holder arms are secured by stud bolts to surfaces which are machined on the ribs of the frame, parallel to tangents at the points of contact with the brushes.

With all but the two smaller sizes, a shunt is connected to the tip of the spring, extended back over the spring and securely fastened to the brush holder, thus relieving the spring of the duty of carrying current, insuring good contact, low operating temperature and a permanent and even tension. With every carbon brush five-eighths inch or more in thickness an additional sheet is provided connecting the carbon itself to the carbon holder, improving the contact between carbon and holder and preventing that pitting of the brush which is so annoying and troublesome, besides offering a further protection to the temper of the spring.

Flexible leads are brought out through insulating bushings in the upper frame and are either connected to terminal blocks mounted on the top of the motor, or are arranged for direct connection to the controller lines.

American Associaton in Session.

The American Association for the Advancement of Science and the American Physical Society are holding their annual meetings in Philadelphia, Pa., this week. The sessions are being held in the Morgan Laboratory of Physics of the University of Pennsylvania. The programme includes many papers on scientific subjects. About 1,500 persons were present at the various meetings on the opening day.

Ohio Telephone Notes.

The Village Council of Lakewood, a Cleveland suburb, has contracted with the Cuyahoga Telephone Company to erect at designated points on the streets six telephone instruments for the use of the police and for fire-alarm service. The instruments will be mounted in weatherproof metal boxes, with lock and key. The patrolmen and firemen will be provided with keys, and several keys will be left at neighboring houses, so they can be had in case of fire.

The Farm and City Telephone Company of Van Wert has been incorporated with a capital stock of $20,000. The incorporators are F. W. Purmort, J. A. Wilmore, J. W. Miller, David Counselor and Hugh E. Allen.

For a few days before Christmas the Cuyahoga Telephone Company placed an operator in charge of the "Santa Claus" calls, resulting in much amusement as well as satisfaction on the part of the children. In each case the operator secured the address of the child calling and then sent a list of the things asked for to the parents. In this way the children feel that their requests were granted. This company is becoming more popular all the time because of the little innovations of this kind it introduces.

The stock of the Sugar Grove Telephone Company, Sugar Grove, has nearly all been sold, and the work of erecting poles and stringing wires will begin within a short time.

A suit to recover $3,500 has been brought against the Hotel Euclid Company in Cleveland by the Cuyahoga Telephone Company, the allegation being that the hotel company has taken forcible possession of a complete telephone system placed in the building. Owing to some trouble a few weeks ago the hotel company refused to receive the service of the Cuyahoga Telephone Company and had the Bell company connect its wires with the private exchange which the former had installed in the house.

Checker players of Uniopolis and Waynesfield are conducting a series of games by telephone. A man at each end of the line calls the moves, and it is said the games are played in about the same time as when the players are actually together.

The November statements of all the companies auxiliary to the Federal Telephone Company show a very satisfactory surplus. It is thought that the entire year will show a nice average gain over last year. Each company has striven to make an increase in its business, and most of them have succeeded. C.

Telephone News from the Northwest.

A syndicate of Minneapolis men, headed by S. S. Thorpe, has purchased the Iowa properties of the Mississippi Valley Telephone Company and will proceed to enlarge the system. Thomas Peebles of Minneapolis is secretary and general manager. The company has exchanges at Muscatine, Burlington, Keokuk, Fort Madison and Wapello, Iowa. The old name of the company is to be retained.

A petition has been presented to the Legislature of Canada for authority to form and incorporate the Independent telephone company of Canada, the promoters being Minneapolis men. A local system is to be installed for Winnipeg, with connections to the towns of the province. The capital stock is fixed at $10,000,000.

The telephone exchange at Wadena, Minn., has been rebuilt.

The council of Bismarck, N. D., has granted a new franchise to the Interstate Electric and Telephone Company.

The Twin City Telephone Company gives its subscribers at the Merriam Park exchange, midway between the Twin Cities, a free exchange with Minneapolis, although all the other suburbs of St. Paul have to pay the regular toll.

Citizens of Kerkhoven, Minn., want a local exchange, and propose to buy out the Minnesota Central company, or build a new one.

The Cambridge (Minn.) Telephone Company has been incorporated by local business men with $50,000 capital.

The Farmers' Mutual Telephone Company has been formed to build a rural line from Sunbury to New Liberty, Iowa.

Two new rural telephone lines will be constructed at once at Terril, Iowa.

The Clark Automatic Telephone Company is installing a telephone system at Sergeant Bluff, Iowa.

The new exchange building of the Sioux City (Iowa) Telephone Company has been completed.

The Hamilton County Telephone Company's plant at Webster City, Iowa, has been badly damaged by fire. R.

Southeastern Telephone Developments.

Work has been inaugurated on the handsome new three-story exchange building for the Southern Bell Telephone Company at Greensboro, N. C.

The Bell Telephone Company has applied for the right to enter the town of Chester, S. C., but the local company is said to be opposing the move, together with many of the citizens.

The Southern Bell Telephone Company is installing a new exchange in Fayetteville, Ga.

The long-distance Bell telephone company has nearly completed a line from Charlotte, N. C., to Morganton, a distance of about 100 miles.

A report on the telephones of North Carolina shows that there are 83 exchanges in the state, with 15,632 subscribers, and over 24,000 miles of wire. The total revenues for the year being over $346,000.

The Southern Bell Telephone Company has just completed anbther long-distance line from Lynchburg, Va., to Danville. L.

Indiana Telephone Items.

During a meeting of the Franklin City Council to consider the petition of the Central Union Telephone Company for a local franchise the company asked permission to withdraw the petition, with the view of filing another at an early date. It was discovered that the council and business men generally opposed the ordinance in its present form, and, unless altered, it would never be passed.

There is considerable talk of soon completing an Independent telephone line between Laporte and Chicago, to be operated in conjunction with the automatic system in Chicago. There is a line being constructed from Kendallville to Goshen, and this will connect at Kendallville with the Toledo (Ohio) line. Should such a line be completed, there will be direct telephone connection between Chicago, Toledo, Cleveland, Pittsburg and eastern points.

The commissioners of Gibson County have granted a franchise to a new telephone company to erect poles and string wires in the public highways in Washington, Widner and Vigo townships.

The Blountsville Telephone Company has been absorbed and consolidated with the Cambridge City Telephone Company. R. Lamb is president of the new company and states that many improvements will be installed in the spring.

The Rural Telephone Company is installing a new switchboard at its principal exchange in Milford.

The Princeton Independent Telephone Company is soliciting bids for the installation of a new exchange in Princeton.

James Epperson, state mine inspector, says that telephones are being introduced in the Indiana coal mines and in some instances take the place of the speaking tubes required by law. Mr. Epperson will endeavor to secure a new mining law, leaving it optional with the mine operators to use either speaking tubes or telephones for communication with the miners while at work in the mines. S.

Michigan Telephone Matters.

Within 90 days Detroit will be in telephonic connection with Chicago, Cleveland, Pittsburg, Cincinnati, Indianapolis and other western cities by a new telephone line, according to statements made by J. K. Johnson, manager of the Home Telephone Company. Mr. Johnson is said to voice the intentions of the Independent telephone companies of Michigan, Ohio, Indiana and Illinois. He is trying to make arrangements with the Illinois Tunnel Company, which already operates an extensive telephone service in the downtown district of Chicago, for outside connection.

W. C. McMillan, a director and stockholder of the Michigan State Telephone Company, and W. A. Jackson, president of the company, have just returned from a trip East, where they conferred with interests identified with the company prior to the annual meeting of stockholders to be held in Detroit January 10th. It is understood that some interesting figures as to the progress of the company during the year will be submitted at the meeting. W.

Northwestern Cedarmen's Association.

The ninth annual meeting of the Northwestern Cedarmen's Association will be held at the Hotel Pfister, Milwaukee, Wis., on Tuesday, January 3d, at 2 p. m. All standing committees will meet at 10 o'clock in the forenoon of the same day, as also the board of directors. Any matters for the consideration of the committees or the directors should be in the hands of the secretary before that date. Members of the association who cannot be represented at the meeting are requested to send to the secretary, previous to the meeting, such information regarding the condition of stocks in their hands and their contemplated input this winter as will be of value to the association.

NEW COMPANIES.

The Howardsville Telephone Company of Lena, Ill., has been incorporated to operate a system of telephones. The incorporators are Edward Fisher, G. W. Davis and F. A. Howard.

The Palmyra (Neb.) Telephone Company has been incorporated with a capital stock of $4,000.

The Ridge Farmers' Telephone Company of Hartline, Wash., has been incorporated with a capital stock of $10,000.

The Manila Telephone Company has been organized at Manila, P. I., with a capital stock of $500,000. It is estimated that it will cost $90,000 to install an effective modern system in Manila, and large sums will be spent in extensions.

J. B. Long of the Amity Mutual Telephone Company of Amity, Ore., reports that an Independent mutual telephone company has been organized at Belleview, Ore., and work has already been commenced on the line. The new company will have three lines to Amity.

Hygienic Resonator for Telephones.

The following description relates to the Hoglund hygienic resonator as exhibited at the recent Independent telephone convention in Chicago. This device is not a disinfecting contrivance but an instrument founded on scientific principles, and embodies a number of features that have gained for it much appreciation among telephone men, who have previously been everything but favorable to so-called disinfecting mouthpieces.

The resonator, as described by Mr. G. Hoglund, the inventor, is a "booster" for deteriorating transmitter, inasmuch as its acoustic properties increase the vibrations of the diaphragm without causing any increased packing. A peculiar construction with a convex mirror in front will prevent people from approaching the telephone too closely, serving the double purpose of preventing shouting in the telephone and also preventing the breath from entering the transmitter, and thus preventing contagion by too close approach to the mouthpiece. This hygienic feature without a disinfectant has made the resonator a great favorite with the public whenever applied to public telephones as well as with station managers, who also appreciate the acoustic properties of the resonator in increasing the volume of the voice, thus making their telephone service more satisfactory to the public. The resonator gives a neat and finished appearance to the telephone.

The invention is handled by the Hoglund Hygienic Resonator Company of Chicago, which expects that the device will be popularly received.

GENERAL TELEPHONE NEWS.

A receiver has been applied for to take charge of the Jones County Telephone Company of Anamosa, Iowa.

The telephone companies at Topeka, Kan., are installing private exchanges in the three largest hotels of the city.

The New England Telephone and Telegraph Company has cut its pay-station rates from 10 cents to five cents per call in Boston.

The Pacific States Telephone and Telegraph Company has awarded to Logan & Johnson of Nezperce, Idaho, the contract for the construction of its lines from Dublin to Mohler, Idaho.

Representatives from the Kinloch Telephone Company of St. Louis have been in Kansas City recently looking over the plant of the Home Telephone Company and gathering ideas for the new six-story building for the Kinloch exchange in St. Louis.

The City Council of Palm Beach, Fla., has appointed a committee to investigate the matter of granting a franchise to a new telephone company or encouraging the old company, provided it is reorganized and guarantees good service.

The Royal Trust Company of Chicago has applied to the courts for the appointment of a receiver for the Citizens' Telephone Company of Sioux Falls, S. D. The Chicago company holds $163,000 in bonds on which it is said a year's interest is in default.

It is said that Pleasanton, Iowa, with a population of 300, has an Independent telephone company capitalized at $2,000, operates 60 telephones at $15 for business and $12 for residences, and pays 40 per cent. dividends. It has five toll lines, from which it derives an income.

Independent telephone men of the Northwest—all of South Dakota east of the Missouri River, Southwestern Minnesota and Northwestern Iowa—will hold their annual convention in Sioux Falls, S. D., on January 11th and 12th. An interesting programme will be presented.

The farmers of Chemawa Precinct, Ore., have organized a telephone company for the purpose of putting up a mutual telephone system. William Goodrich of the company will endeavor to arrange with the Pacific States company for connections. The company proposes to connect with Yamhill lines at Wheatland, Ore.

Charles E. Sumner, vice-president and general manager of the Empire State Electric Company of Toledo, Ohio, is preparing to apply to the council of Spokane, Wash., for a franchise for telephones in that city. It is understood that Mr. Sumner has applied for a franchise at Portland, Ore., and, with the system at Spokane, proposes to co-operate with the Independent system at Seattle, Wash., and eventually make long-distance connection throughout the Pacific Coast.

At a recent meeting in Philadelphia of the Eastern Traffic Association of Independent Telephone Companies the matter of long-distance telephone connection with points as far west as Kansas City and St. Louis via the lines of the Keystone Telephone Company was settled. The meeting followed a session of the Pennsylvania State Independent Telephone Association in the offices of the Keystone company. Officers of companies in Pennsylvania, New Jersey, Delaware and Maryland were present. New rates, rules and regulations were fixed by the Traffic association and announcement was made that the new long-distance service will be in operation early next year.

CORRESPONDENCE.

Great Britain.

London, December 14.—Some further particulars of the condition of things as exposed at the recent annual meeting of the British Westinghouse Electric and Manufacturing Company will be of interest as showing what the electrical industry in this country has been passing through. As I have previously pointed out, many people here refuse to believe that foreign competition has had anything to do with the present bad condition of trade, but apparently Mr. W. I. Buchanan, deputy chairman of the British Westinghouse Company, thinks otherwise. He said that it was not the actual amount of business being contracted in Great Britain by foreign firms that was doing harm, but rather the influence which the presence of that foreign competition in all important tenders exerted upon the prices quoted by British manufacturers. Consequently, British manufacturers had to try in advance to discount the unknown outside price, with the net result that much lower prices were made by British companies under such conditions than would be the case were the competition they had to meet limited to British competition alone. Practically speaking, it was difficult to see how we could effect reprisals with the present fiscal policy of this country. The Westinghouse company had now set about reducing expenses and the cost of manufacture and much had been accomplished in that direction.

A trial trip was made upon the electrified portion of the Metropolitan railway this week. Even nowadays it seems to some people quite a feat to propel a train electrically. The leading daily newspaper, the Times, seemed quite surprised and pleased that the train in question should have been propelled over some 25 miles of track without having to call in the aid of a steam locomotive. The opening of the lines of the Metropolitan company beyond the much-discussed "Inner Circle" has been brought about owing to the fact that the company is sole owner and not a partner with another company, as in the case of the Inner Circle. It is satisfactory to learn, however, that a perfect understanding exists between the partners concerning the working of the latter and that electrical working on this line will shortly be in fact accomplished.

At the annual dinner of the Institution of Electrical Engineers last week in considering the toast "Our Transatlantic Kinsmen," some remarks were made which should interest the American engineer. The work of the newer hemisphere in connection with the electrical industry it had been impossible to forecast, but it was not astonishing when it was remembered that this had been capable of accomplishment unhampered by the moss which grew with age in the older countries and with a freedom of action which was impossible here. The speaker believed, however, that in the future things would have to be conducted more and more on the lines of those in the older countries. In conclusion a hearty tribute was paid to the magnificent welcome accorded to the members of the Institution by American electrical engineers during their recent visit to the United States.

A report has been presented to the London County Council advising that in view of the magnitude of the council's electric-tramway undertaking the various parts and details of the rolling stock and plant should be standardized and that standard samples and patterns should be immediately prepared of all the various parts. This was agreed to, the cost of preparing the various patterns and drawings being placed at $1,750.

In connection with the various large power supply schemes for London, which were referred to a few weeks back and which will be put before Parliament this session, a movement is on foot to offer combined opposition against all of them in behalf of the various London Borough Councils. It has been decided to call a conference of the London Borough Councils and the London County Council to consider the steps to be taken to protect the interests of municipal electricity supply undertakings in London.

The question of dealing with goods traffic upon electric tramways has come to the fore during the year. An account has just been issued of the parcels traffic conducted upon the Bradford corporation electric tramways during 1904, from which it is seen that 250,000 parcels were carried at an average rate of two cents per parcel, the gross profit being £1,000. A huge and comprehensive scheme for the carrying on of such traffic has now been submitted to the corporation for approval. Under this scheme the delivery of parcels will be carried on by motor vans in districts where the tramways do not travel. Intercommunication with other tramway systems for the same purpose is proposed.

The English house of J. G. White & Co. has received the contract for the conversion of the whole of the Belfast horse tramways to electric traction. The price is over $2,500,000. G.

New York.

New York City, December 24.—The city will take steps to appeal against the injunction of the Supreme Court forbidding the payment of outstanding lighting accounts. Meanwhile, Comptroller Grout is pushing a preliminary investigation into the subject. The Manhattan and Bronx Electric Company has a plan for a lighting plant and asks permission to use the ducts of the Consolidated Telegraph Company for lighting and power wires. Sundry public associations have endorsed the demand for establishing a municipal lighting plant.

The Metropolitan Street Railway Company foreshadows that it will apply for a modified route for an East Side subway to be constructed by J. B. McDonald. It is now proposed to run up Third Avenue instead of Lenox Avenue, so as to facilitate a physical connection with Mr. McDonald's proposed electric lines in the Bronx.

The Interborough Rapid Transit officials are to replace all the copper-sheathed wooden cars in the subway by steel cars. The wooden cars are to be gradually removed to the Second and Ninth Avenue lines. The lower portion of the subway is to be opened as far south as Fulton Street early in January. The tracks, including the third rail, are already laid, while the tunnel itself has been constructed as far as Battery Place.

The certificate of the franchise for the Sixth Avenue subway was handed to Mr. McAdoo on Wednesday. The franchise provides for 12 stations. There are to be no exits or entrances on public property without special permission. Work must be begun within six months and completed within five years. For the first 10 years the company is to pay a rental of 50 cents per linear foot of track, a lump sum of $9,000, and three per cent. on the gross earnings. After 10 years the rental is to be increased to $1 per foot, and five per cent. of the gross earning. The franchise is for 25 years.

President Orr of the Rapid Transit Commission announced on Thursday that the committee in accepting Mr. Parsons' resignation as chief engineer will nevertheless retain his services as consulting engineer. The commissioners have unanimously decided on the appointment of George S. Rice as acting chief engineer.

The new Grand Central Station, which is to include a side station for a number of electric subway lines, will occupy 19 blocks in place of the five on which the present terminal stands. The total cost of land for the site, even at a low appraisement, will be about $10,000,000. As now arranged, the suburban trains are to arrive at the underground level of the terminal, from which there will be a direct opening to a large subway station adjoining. The express trains are to arrive on the ground level, and the stairway to the subway is to open from within the concourse. It is now hoped that there will be a direct connection between the Grand Central Station and the subway between New York and Jersey City.

The Court of Appeals has given a decision in favor of the New York City Interborough Railroad Company, which proposes to lay six new lines of electric traction in the Bronx. This application had been turned down by the railroad commissioners.

The New York City Railway alleges that it has been losing $1,000 a day through a fraudulent use of transfers.

The Rapid Transit Commission is preparing a bill to be presented at Albany to enable the city to construct pipe galleries as accessories to future subways. It is contended that these pipe galleries would soon pay for themselves.

Great opposition has been shown by the chief of construction of the navy and the bureau chiefs at Washington to the plan advised by civilian experts to consolidate the power plants of the Brooklyn navy Yard. Notwithstanding the opposition of the naval experts, it is intended that the question shall be referred to Congress and an effort will be made to have provision in the annual appropriation bill for carrying out the plan of consolidation.

At Albany, this week, the Jacques Ochs Company, for the manufacture of arc and incandescent lamps, whose plant is situated in Brooklyn, was incorporated with a capital of $5,000. D. W. W.

Dominion of Canada.

Ottawa, Ont., December 24.—The gross returns of the electric street railway of Trinidad, B. W. I., for the month of November last, amount to $17,850 and the net profits to $10,550, making an increase in net profits over November, 1903, of $1,750. This places the company's stock on an earning basis of 8½ per cent.

The Canadian Westinghouse Company's nine new buildings in the city of Hamilton, Ont., have been completed and within a few weeks some 1,000 skilled mechanics will be occupying them. The company has begun to install the new machinery. The sprinkler system will be one of the best in the world.

The County Council of the county of Waterloo, Ont., has passed a resolution indorsing the movement on foot to establish a rural telephone system in the county, and against the granting of exclusive franchises to the Bell Telephone Company by any of the municipalities of the county, which might prevent the rural line from obtaining connection with municipalities. The council also decided to support the proposition to again memoralize the government to enact a law that, until the long-distance lines be taken over by the government, compulsory service be given over long-distance lines at rates approved by the government.

The Montreal Street Railway Company has opened its new electric railway through the town of St. Paul, as well as the new line to the locomotive works at Longue Pointe. The distance between the two points above named is a little over nine miles, which, at certain times in the day, can be covered for a fraction over three cents. The company has also under consideration the extension and completion of its suburban lines, and within another year many points in the vicinity of Montreal, now reached by steam cars, will be served by the electric system.

During the last few years scores of private plants for the lighting and power supply of individual buildings or groups of buildings under one ownership have been erected in the city of Montreal. The most recent of these plants is that of the Central Electric Company, an enterprise controlled by members of Carsley & Co. This is the first independent company formed for supplying electricity in Montreal since the small electric companies were all absorbed by the great power corporations, and it is consequently looked upon as a development of great significance. The new company has already working three engines and dynamos of English manufacture. The great advantage claimed for them is that they are particularly suited for an installation in a closely built district. The capacity of this plant is 700 horsepower, with room for considerable expansion, both of boilers and engines.

The Westinghouse people are completing a fine 150-kilowatt system for the Bank of Montreal, and they have also erected plants in many other large buildings. The Allis-Chalmers Company has also installed a considerable number of private electric-lighting and power plants in the city, as has also the Canadian General Electric Company. A few years ago it was thought that the day of the 500 or 1,000-horsepower steam-generated electric power plant was over. Today, however, private plants are springing up in every direction throughout the city of Montreal. W.

New England.

Boston, December 24.—Justice H. H. Chase, who held the inquest concerning the recent death of Harry B. Masters of Brockton, finds that the Edison Electric Illuminating Company of Brockton is responsible, death having been due to a shock from the electric-light wire, and that the company had been advised of the strong current on the wire several days before the accident.

At a meeting of the Boston transit commissioners this week it was decided to open the East Boston tunnel to public travel on Friday, December 30th.

Gen. William A. Bancroft, president of the Boston Elevated Railway Company, has returned from his observation trip to Europe. He visited five different countries, inspecting the electric-railway systems of many important cities and conferring with railway officials in these centers.

On Saturday last, at Middleboro, Mass., the property of the Middleboro, Wareham and Buzzard's Bay Street Railway Company was sold at auction, the purchasers being John A. Arnold and George H. Newhall of Providence, and Charles F. Choate, Jr., of Boston. Their bid was the only one, and $35,000 was the amount, subject to mortgage bonds of $150,000, a receiver's loan of $20,000 and preferred claims of $50,000 aggregate. The Bristol County Street Railway Company's property was also sold at Middleboro on the same date for $30,000 to the same trio, subject to bonds of $200,000 and other obligations. A merger of the two roads is expected.

Gen. Thomas Sherwin, president of the New England Telephone and Telegraph Company, was the guest at luncheon on Wednesday of the directors of the Boston Merchants' Association, and gave a very interesting address on the subject of telephone service, incidentally answering, in an informing way, numerous questions propounded by his auditors relative to rates, cost of service and improvements in the system.

The annual meeting of the Boston Elevated Railway Company will be held in Boston on January 2, 1905. The West End Street Railway Company (leased) will also hold its annual meeting on that date.

Part of the plant of Osgood, Bradley & Son, car manufacturers at Worcester, was burned December 19th, as the result of a gas explosion. Two workmen were badly scorched. The property loss was about $10,000, it is estimated.

Electrical workers in New England will receive a substantial increase in wages on January 1, 1905. An agreement has been made which stipulates the degree of skill required of the men. A joint committee of employers and employes will examine applicants for work as journeymen and helpers and issue certificates.

The Charles T. McCue Company of Hartford and the Hubbard Motor Company of Middletown are two new companies recently incorporated in Connecticut with a capital of $50,000 each. The concerns will construct motors, engines, machinery, vehicles, etc. B.

Southeastern States.

Charlotte, N. C., December 24.—A movement is on foot, backed by business men of Manning, S. C., and other points, to build an electric railway from Manning, through Summerton, to Wright's Bluff.

The Carolina Water, Light and Power Company, with $250,000 capital stock, proposes to construct

and maintain water, light and power plants in Marion, S. C.

The town of Douglas, Ga., is contemplating the letting of contracts for a lighting system, for which bonds were issued some time ago.

The town of Martinsville, Va., has voted $60,000 for a lighting and power plant in the city. The power will be developed on Smith River.

F. W. Siebert is manager of the new $8,000 electric-light plant at Lexington, N. C. The machinery has been shipped and the work is now well under way on the new plant.

An extension may be built in West Asheville to the electric-railway system of Asheville, N. C.

After much litigation to prevent the sale of the Bay Shore railroad and the Hampton Roads Railway and Electric Company of Virginia, an order has finally been signed for the sale of the two roads, and appointing H. H. Little and R. T. Thorp, respectively, special masters of the roads.

The Raleigh (N. C.) Electric Railway Company has made an offer to sell out to the new Raleigh and Durham Electric Railway Company, which has secured a franchise in Raleigh for 60 years. L.

Texas.

Austin, December 22.—The project of building an interurban electric railway between San Marcos and Luling, Texas, has been taken up by local and outside capitalists. The route will be down the valley of the San Marcos River, passing through the towns of Martindale, Staples, Prairie Lea and other smaller places. The line will be about 14 miles long. Judge B. G. Neighbors of San Marcos is interested in the project.

The Port Arthur Electric Street Railway Company of Port Arthur, Texas, has completed a survey for the proposed extension of its line to the deep-water docks, a distance of about two miles, and thence to the oil refinery and to West Port Arthur.

H. F. McGregor, manager of the Houston Electric Company, and John Tod of Houston have been investigating the situation at Corpus Christi with the view of constructing an electric street-railway system. They are said to represent a syndicate of eastern capitalists, who will undertake the work if the report is favorable.

A syndicate of St. Louis capitalists propose to build an interurban electric railway between Brenham and La Grange, Texas, a distance of about 25 miles. Citizens' committees have been appointed in each of the towns to raise the required bonuses and obtain the right-of-way for the proposed road. G. A. Heilig and J. F. Wolters of La Grange are the active representatives of the St. Louis persons in the enterprise.

The Temple-Belton interurban electric railway has been placed in operation. H.

Mexico.

City of Mexico, December 21.—The American syndicate represented in this city by Captain Charles Holt, who recently purchased Mt. Popocatepetl, is said to be preparing plans for the construction of a monorail railroad from the town of Tlamacos to the crater.

If the plans of a syndicate of New York and Philadelphia capitalists are carried out one of the largest electric power plants in Mexico will be established at the Malinaltenango Falls, in the district of Tenancingo, state of Mexico. Major George B. Burbank of New York city and A. S. Harvey of Leadville, Colo., engineers representing the Americans interested in the project, accompanied by George Stuart Simons of New York and William Mackenzie of San Antonio, Texas, have just finished a thorough examination of the falls with the view of ascertaining the waterpower available. There are three falls, from which it is thought 25,000 electrical horsepower can be developed for transmission to the City of Mexico and other places within easy distance of the falls.

The great Zoquitleco waterfall, situated near Corales, Mexico, which was owned by Andres Solon, has been sold to him by a Belgian syndicate. The purchase price was $400,000. It is announced that the syndicate will establish a large electric power plant for supplying power to its large sawmills and to other industrial concerns in that section.

The Bermejillo interests, which own the street-railway system in the city of Guadalajara, Mexico, have not abandoned their efforts to obtain from the Mexican government a concession for the establishment of an electric street-railway system in that city. In anticipation of securing the concession plans have been prepared for a large electric power plant to be located about two miles north of the Juanacatlan Falls, in the state of Jalisco. The government of the state of Jalisco has granted Francisco Laveaga of Guadalajara, Mexico, a concession to establish an electric power plant on the Ayutla River near Union de Tula, and to use the waters of that stream to operate the plant. The electrical energy to be generated will be used to operate the machinery of the reduction mill and other works at the Casa Blanca mines, of which Mr. Laveaga is manager.

John J. Moylan of the City of Mexico is having plans prepared for a large electric power plant which he will construct on the San Cristobal River, near the town of San Cristobal, state of Guerrero.

The American company represented by Sidney Sprout successfully competed with Oscar Braniff of the City of Mexico for the contract to construct and operate an electric-light and power plant and electric street-railway system in the city of Culiacan, state of Sinaloa. Mr. Sprout has made a deposit in the city treasury of Culiacan as a guaranty that the terms of the franchise which has been granted to him on behalf of his company will be carried out.

The government of the state of Jalisco has granted a concession to Carlos Navarro Mora of Guadalajara, Mexico, to establish an electric-light and power plant at Chapala, Mexico. Mr. Mora will furnish lights for the city of Chapala and the cottages on the shore of Lake Chapala and will also erect a flour mill which will be operaated by electricity from the power plant. H.

Ohio.

Cleveland, December 24.—The annual meeting of the Columbus, Delaware and Marion Railway Company and the Columbus Northern Railway, Power and Equipment Company will be held at the Chittenden Hotel, Columbus, on the afternoon of January 2d, when the plans for taking over the properties of the Columbus, Delaware and Marion and the lighting and power companies will be discussed.

Claims against the Miami and Erie Canal Transportation Company are being settled, and it is believed that everything will be in good shape within a short time.

Mayor Finch of Toledo has decided to sign the ordinance authorizing the lighting committee to enter into a contract for street lighting for from two to five years. The Toledo Railways and Light Company will probably get the contract.

The Bullock Electric Company of Cincinnati has been incorporated with a capital stock of $2,500,000, to take the place of the New Jersey corporation under which the big Bullock plant has been operated. Of the entire amount, $1,000,000 will be common stock and the remainder six per cent. cumulative preferred stock. The articles provide that if dividends are not paid for two years the preferred stockholders may elect new directors. No mortgage is to be placed on the real property except for the acquisition of additional real estate. Neither is the machinery or plant to be mortgaged to the detriment of the stockholders.

A decision of the Circuit Court requires that the City Railway Company of Dayton must thoroughly bond its tracks to prevent the escape of electricity into the earth.

The lighting arches on High Street, Columbus, are again under discussion, but it is believed arrangements will be made to retain them. This is a novel way of lighting a business street, and has attracted much attention.

The new municipal plant at Columbus is almost ready for operation in a portion of the territory it will serve. The plant has been tested and found to be in good shape. The city will have an opportunity to thoroughly demonstrate whether there is anything in municipal ownership.

For the purpose of building a new road between Canton and Akron, the Buckeye Streeet Railway Company has been incorporated with a nominal capital stock of $1,000, by J. H. Van Der Vere, Edward H. Tracey, Davis Hawley, S. D. Reed and J. E. Chadwick, all of Cleveland. These men have not given out much detailed information regarding the company.

An electric plant will be built at the Pennsylvania railroad docks at Ashtabula for the purpose of operating the ore-hoisting machinery.

Reports are still in circulation to the effect that the Toledo, Columbus and Cincinnati Electric Railway Company has been financed and that it is now sure to be built. W. H. Luctenburg, the Columbus contractor, is one of the men now deeply interested in the proposed line from Cincinnati to Toledo.

Fifty convertible cars have been ordered by the Cleveland Electric Railway Company. The Brill Car Company secured the order and the work will be done at the Kuhlman shops in Collinwood, near Cleveland.

President J. M. Morgan of the Cincinnati, Toledo and Detroit Short Line Railroad Company says that the proposed line will be operated by electricity, but will not be a trolley line. It will, he says, be an electric railroad in every sense of the word.

Cleveland bondholders of the Springfield and Xenia Traction Company purchased the property of the company at receiver's sale a few days ago for $225,600, the last appraised value being $200,000. The outstanding bonds amount to $425,000, and $75,000 of bonds have been put up to secure a floating indebtedness of $60,000. The plan is to operate the road in connection with the lines of the Bushnell syndicate.

At a meeting of the stockholders of the Toledo, Bowling Green and Southern a few days ago, it was decided to lease the property to the Toledo Urban and Interurban Railway Company, which is backed by the Kilgour and other interests. The first year dividends of one-half of one per cent. will be paid and the percentage will increase until the stockholders will receive four per cent. on the tenth year, after which it will remain the same.

A mortgage for $1,500,000 has been filed with the Ohio Trust Company by the Springfield, Charleston, Washington and Chillicothe road to secure a bonded indebtedness for the same amount.

Indications are that the committee in charge of the Everett-Moore affairs will retire by the first of the year and the syndicate will be given possession of its securities. It will then complete the work of straightening out its affairs, and, without doubt, will continue the work of promoting and developing electric-railway and telephone properties. O. M. C.

Indiana.

Indianapolis, December 24.—The city of Greencastle has brought suit against Albert Lieber, principal owner of the Indianapolis and Plainfield traction line, and the Federal Surety Company on a $5,000 bond to insure the operation of interurban cars between Indianapolis and Greencastle by September 1, 1904. Much work has been done, but the line lacks many miles of reaching Greencastle.

A move is in prospect to unite the interurban electric companies operating in eastern Indiana and western Ohio, so that from them will be formed a system of electric railways closely connecting Indianapolis, Fort Wayne, Cincinnati, Columbus, Springfield, Cleveland and Toledo. The moving spirit in the undertaking is the Elkins-Widener syndicate, largely interested in Indiana and Ohio lines. Hugh J. McGowan, Indianapolis representative of the syndicate, would neither affirm nor deny the report, but admitted enough to indicate that the plans are so far along that the success of the undertaking cannot longer remain a subject of doubt. They call for through lines from all the large cities reached, and will bring hundreds of miles of electric railways under one management and in one system.

The Seagraves electric line has been developing new life in northeastern Indiana. Butler City has granted the company a new franchise, and the syndicate is working for new franchises in Auburn, Garret, Kendallville and Waterloo. Work is to begin in the spring.

The Indiana Railway Company, operating between South Bend, Mishawaka, Goshen and Elkhart, has been consolidated with the Indiana Western Railway Company, constructing an electric line westward from South Bend through Laporte County. The articles of consolidation authorize the directors of the merged corporation to issue $3,000,000 in bonds.

Ten new cars have been received from the St. Louis Car Company for the Rushville line of the Indianapolis and Cincinnati traction line, to be opened January 1st. The new cars are large and heavy.

A company is organizing in Indianapolis for the construction of an electric railway south from Terre Haute to Vincennes. The company will be capitalized at $1,500,000. J. M. Heath is promoting the road and will superintend the preliminary survey.

The Indianapolis and Ohio Valley Traction Company is a new company to file articles of incorporation during the week. Its capital stock is placed at $50,000. The line will be 150 miles long and connect Indianapolis, Nashville, Bloomington, Bedford, Mitchell, Paoli, West Baden, French Lick, Jasper, Rockport, Troy, Tell City and Cannelton. Joseph H. Larimer, Butler Smith, A. E. and E. J. Fauve of Indianapolis and Peter Baker of Troy are the principal stockholders and incorporators.

The Indiana Shippers' Association is opposed to incorporating in the bill to go before the next Legislature for a state railroad commission the power to deal with the question of protection for grade crossings, as such a provision will endanger the passage of the bill.

The Indiana farmers will attempt to secure legislation that will almost prohibit automobiles or vehicles propelled by steam, electricity or gasoline from the use of the country highways.

The government has directed George F. McGinnis, postmaster at Indianapolis, to make contracts for the transportation of mail on the interurban lines out of Indianapolis. The schedule calls for five mails each way daily. S. S.

Michigan.

Detroit, December 23.—A map has been filed with Railroad Commissioner Atwood at Lansing, showing the complete route of the Detroit and Bay City Traction Company. There are 15 crossings with other railroads which are asked to be allowed at grade.

The Detroit United Railway Company's "Trolley Song" contest for a prize of $200 will close at 6 p. m., Saturday, January 7th, and no manuscripts will be received after that hour. The conditions of the contest were published in the Western Electrician some months ago. Many manuscripts have already been received from various localities, and a set of judges will determine which one will receive the prize.

The through freight and passenger service which will be inaugurated early in January over electric roads between Detroit and Cleveland, by way of Toledo, will be an active competitor of the Detroit and Cleveland Navigation Company and the Cleveland and Toledo line of steamboats, but the White Star Line, between Detroit and Toledo, will feel the effects of the Detroit, Monroe and Toledo Short Line to the greatest extent. General Freight Traffic Manager D. C. McIntyre, of the Detroit and Cleveland lines, discusses the situation freely. He said that, as far as his interests were concerned, the Lake Shore electric road between Cleveland and

Toledo would cut heavily into the freight receipts of the Cleveland and Toledo steamboat line. Where the steamboat companies are at a disadvantage is that they are out of the field for three or four months of the year, when the river is closed by ice, while the electric lines are in operation the whole year. Business diverted from the steamboat lines to the electric lines during the winter is hard to get back, rates being equal.

Detroit's mammoth automobile industry receives a powerful impetus by the reorganization of the Reliance Automobile Manufacturing Company, just consummated under the new corporate name of the Reliance Motor Car Company, for the purpose of continuing the manufacture of the Reliance car. The new corporation begins business with a capital of $400,000 and a splendid executive force, under the presidency of J. M. Mulkey. Frank R. Thrall is the general manager.

An ordinance has been introduced in the council for the reduction in the price of electric lights. It is intended to accomplish this by regulating the rates at present charged by the Edison company. The ordinance provides for a rate of 10 cents per kilowatt-hour for the first 75 hours and five cents thereafter. The ordinance was given its second reading and laid over for one week.

The Grand Rapids-Muskegon Water Power Electric Company was recently organized under the laws of Maine, with a capitalization of $1,000,000, for the purpose of building one or more dams on the Muskegon River, for developing electrical current for commercial purposes in Grand Rapids, Muskegon, Big Rapids and other places. The first dam will be built at Rogers Bridge, about six miles below Big Rapids. Preliminary work upon this is already well under way, and it is hoped to be in a position to deliver the current in this city by August of next year. This dam will be capable of developing 3,000 horsepower for 24 hours at low water. With the transmission line to this city, the cost of this work is estimated at $400,000. C. G. W.

Northwestern States.

Minneapolis, December 24.—The Waterloo and Cedar Falls (Iowa) Gas and Electric Company has been voted a franchise at the latter city.

The new electric-light plant at Shell Lake, Wis., has been completed.

The Pathfinder Electric and Water Power Company has been formed by G. L. Shumway and will erect a power plant at Gering, Neb., at a cost of $85,000.

The public Service Club of St. Cloud, Minn., has been incorporated by E. E. Clark and others for the purpose of constructing an electric-light and power plant. It is capitalized at $300,000.

The Ashland (Wis.) Light, Power and Street Railway Company may build an interurban line from Ashland to Superior, Wis.

The Wisconsin Light and Power Company has been incorporated at La Crosse with a capital of $200,000. J. J. Hogan heads the list of incorporators. The company will apply at once for a franchise at La Crosse, Wis.

A vote will be taken at Gillett, Wis., on January 3d on the proposition to establish an electric-light plant there at a cost of $6,000.

Bids will be received shortly by R. M. Schofield, quartermaster, for an addition to the electric-light plant at Fort Snelling, Minn. The improvement will cost about $10,000.

The R. I. Light and Power Company will put in a new electric-lighting plant at Ludden, N. D.

S. A. Vopatek of New Prague, Minn., will incorporate the Montgomery (Minn.) Electric Light and Power Company. A light plant will be built at Montgomery. R.

Pacific Slope.

San Francisco, December 23.—A. D. Schindler, general manager of the Huntington electric lines in and about Los Angeles, Cal., is in San Francisco on business matters. John A. Cranston, head of a big electric concern at Portland, Ore., is also in the city.

The steamship Minnesota, said to be the largest freight and passenger vessel under the American flag, is in the harbor of San Francisco. The electrical equipment of this huge vessel is wonderfully complete. There is an electric heater and telephone in every stateroom, and at the central telephone office there is always an operator on duty. The handling of the cargo is accomplished by 36 noiseless electric winches. In the galley there are electric broilers, electric dough mixers and electric plates for the making of hot cakes. In the pilot house electricity works the whistle, operates the steering gear and carries messages from the bridge to the engine room and other parts of the ship. Also an electric clock takes charge of the fog signal in thick weather, and another electric device stands guard over the electric lamps which constitute the side lights and other law-required illumination. If one of these lights goes out, a bright lamp glows in the pilot house and a bell rings, and neither ceases until the extinguished light is again in commission.

The California Gas and Electric Corporation, which recently contracted with the United Railroads of San Francisco to supply electric power for the operation of the entire system, has let the contract for the generators of the new plant. The Abner Doble Company, representing the Crocker-Wheeler Company, will supply the set, which will consist of three machines having a capacity of 4,000 kilowatts each. They will be direct connected to 5,500-horsepower gas engines. The generators will deliver 25-cycle, three-phase, alternating current and will feed into the railway system through the present sub-stations. This contract is an important one, both on account of the size of the units and because of the prominent part which the big transmission company evidently intends to play in the local power field.

Capt. W. T. Forsman, projector of the proposed Northern Electric Railway and Navigation Company, has returned to Colusa, Cal., from San Francisco, where he has been engaged in making arrangements for the commencement of initial work on the company's power plant at Butte Creek. E. W. Sutcliffe will superintend the construction of the plant, which will cost about $275,000.

It is announced that Contra Costa County, Cal., will soon be connected with Oakland by a complete electric-railway system that will reach every portion of the county. It is not stated who is behind the enterprise, but the work is actually under way.

The supervisors of Fresno County, Cal., have granted to F. W. Bray a franchise to construct an electric plant and system in Coalinga.

The United Light, Fuel and Power Company has been incorporated at San Diego, Cal., with a capital stock of $500,000. The majority of the stock is owned by John D. Spreckels of San Francisco. The corporation is formed to construct and operate plants for making electric and gas light, fuel and power in the state of California. The principal place of business is San Diego.

The council of San Jose, Cal., has received an application from O. A. Hale, president of the Interurban Railway Company, asking for a franchise for an electric railway from the postoffice on Market Street, San Jose, to Coyote Creek; also for a franchise to extend the line to Evergreen, Berryessa and to the edge of Alum Rock Park.

There are prospects for the establishment of an electric power plant on Rock Creek west of Haines, Ore. Bids for the construction of two reservoirs are being called for, the work to be commenced by June 1st and completed by September 1, 1905. Eilert Eilertson of Haines, Ore., and Senator Walter M. Pierce of Pendleton, Ore., are interested in the project. Water will be conveyed to the power plant by means of a large flume. The plant will be equipped with the latest machinery for furnishing light and power.

An electric railway, 26 miles in length, connecting Portland with Hillsboro, Cornelius and Forest Grove, Ore., will be built and in operation in time for the Lewis and Clark Exposition at Portland, if an agreement can be reached with Hillsboro and Forest Grove regarding a subsidy. The cost of the road is estimated at $600,000. The Oregon Traction Company of Portland is the promoter of the enterprise. A.

PERSONAL.

Robert J. Fleming, city assessment commissioner of Toronto, Ont., has been appointed general manager of the Toronto street railway.

F. F. McGuire of Boston, Mass., has been appointed general manager of the Mexican Telephone Company of the City of Mexico, to succeed Percival Burgess, resigned on account of ill health.

E. F. Phillips, assistant manager for the Edison company and the Peninsular Electric Light Company of Detroit, has gone to Phœnix, Ariz., and Los Angeles, Cal., to spend his first vacation in 14 years.

Alonzo Burt of Kansas City, Mo., president of the Missouri and Kansas Telephone Company, has resigned, it is reported, to take effect January 25th. He will devote his attention to the Wisconsin Telephone Company. Mr. Burt, it is thought, will likely be succeeded in Kansas City by C. E. Yost of Omaha, now acting president.

Gisbert Kapp, the well-known Anglo-German electrical engineer, who left England in 1895 to become secretary of the Verband Deutscher Elektrotechniker, will return to become professor of electrical engineering at Birmingham University. According to the terms of the appointment, Mr. Kapp will be allowed to practice as a consulting engineer.

W. L. Stretlau, who has been superintendent of the Toledo division of the Lake Shore electric road in Ohio for some time, has been appointed superintendent of the Springfield and Xenia electric railway, which was recently purchased by Cleveland men. J. W. Parker, who had been superintendent during the receivership, goes to the Springfield, Troy and Piqua, the Bushnell road.

President F. S. Dickson of the Federal Telephone Company, Cleveland, Ohio, is a great admirer of Thackeray. He has gathered together all the various books and writings of that author, besides the biographies, clippings and everything else he can find relating to him. Many handsome and costly editions of Thackeray's works are on his library shelves, the whole collection containing about 900 volumes. Mr. Dickson became interested in the novelist while at Yale, and has been making a study of him ever since. As a result he has become an international authority on Thackeray and often receives requests for information on points connected with his writings or his life. Mr. Dickson wrote the bibliography of General Wilson's book, "Thackeray in the United States," the story of his lecturing tour here in 1852 and 1853.

Mr. C. W. Whitney has resigned his position as Pacific Coast representative of the McGraw Publishing Company and has become identified with the Abner Doble Company of San Francisco, engineer and manufacturer of tangential waterwheels and needle regulating nozzles. Mr. Whitney, who will have charge of the company's publicity department, is pleasantly remembered in Chicago, where he was associate editor of the Western Electrician.

Mr. Theo. P. Bailey has resigned his position as assistant manager of the Chicago office of the General Electric Company, which position he has held for many years. Mr. Bailey entered the employment of the Vandepoele Electric Light Company in 1882, and soon thereafter was elected secretary of the company, which position he held until 1884, when he engaged his services to the Thomson-Houston Electric Company as selling agent for its electric arc-lighting apparatus in the West. His great success in this work made him easily the choice of his company to assume the direction and management of its railway department in the West, when it took up that work in 1887. In 1892 a consolidation was effected with the Edison General Company, and the General Electric Company was formed. Mr. Bailey was continued in the management of the western railway department of the new company. The company's business had grown so rapidly that in 1893 it was found necessary to divide up the large territory under the control of the Chicago office, and accordingly district offices were established at Denver, San Francisco and Atlanta. In 1888 Mr. Bailey read a paper before the Chicago Electric Club in which he predicted that electricity would in a very few years take precedence over all other forms of power for transporting passengers on street railways. This statement was bitterly attacked at the time by interests controlling the cable railways in fear that, unless mollified, their holdings in cable stocks would suffer a serious depreciation. The wisdom of the prediction has, however, been proved, as is well known. Mr. Bailey has been associated with General Electric interests for just 20 years, and leaves the company with very great reluctance on his own part and with the sincere regret of the officials of the company. He has associated himself with the L. E. Myers Company, contracting engineer, Chicago, and will hold the position of vice-president and general manager. He will enlarge and extend the scope of the company's business at once. Mr. Bailey's long, varied and successful experience in electric-railway and lighting affairs will add great strength to the L. E. Myers Company.

THEODORE P. BAILEY.

A number of important additions have been made to the staff of the Allis-Chalmers Company recently. W. L. Loveland, the newly appointed head of the mining and crushing-machinery department, is widely known among mining men and has at command all the benefits which come from both a technical and practical training. Mr. Loveland graduated from the University of Michigan in the class of 1882 and spent the following eight years as a mining engineer and metallurgist, being actively employed during this time in mining and the erection and operation of mills and smelters. In June, 1897, he was appointed to the position of manager of the mining machinery sales department of the Gates Iron Works, Chicago. He remained with this company until 1901, when there was a consolidation with the present Allis-Chalmers Company, at which time he was appointed head salesman in the mining-machinery department of the Chicago office. H. Schifflin has recently been made assistant manager of the mining and crushing-machinery department, with headquarters in the New York Life Building, Chicago. Mr. Schifflin's connection with the mining and crushing-machinery business began in 1886, when he entered the employment of the old Fraser & Chalmers firm as a draftsman. Mr. Schifflin has therefore been in the employment of the Allis-Chalmers Company or some of its constituent companies continuously during the last 18 years. J. U. Jones of Dallas, Texas, one of the best-known salesmen in the Southwest, has joined the staff of the Allis-Chalmers Company of Milwaukee and will hereafter represent the company and its widely varied products in Texas and its tributary territory. He began his business life as a machinist in the locomotive department of the Texas and Pacific railroad. Then for nine years he was superintendent of the plant of the Paris Gas and Electric Light Company. Leaving that position, he built the Crook-Record plant in Paris, Texas, and operated it as manager for two years in opposition to the older plant. A

combination of the two plants was effected through the efforts of Mr. Jones, who managed the two for a year afterward, as superintendent. The next event in his business career was his joining the Southwestern Electrical and Construction Company of Dallas, Texas, as traveling salesman and superintendent of erection for the plants which the firm installed. Leaving that firm he was for three years in a similar capacity with Collins & Delaney of Paris, Texas, and later with the Murray Compaany, remaining with the latter concern until the time of making his present arrangements.

ELECTRIC LIGHTING.

M. H. Ledford has leased the electric-light plant in Bowling Green, Mo.

Canandaigua, N. Y., is contemplating the establishment of a municipal lighting plant.

The Black Hills Electric Light Company has been granted a franchise by the City Council of Deadwood, S. D.

Bacon, Hays & Wilkey have purchased the business of the Hartzell Light and Milling Company at Poplar Bluff, Mo.

C. H. Dabbs, E. Cahn and others have applied for a franchise to establish a plant for furnishing gas, electric lights and steam heat in Meridian, Miss.

The city of Sturgeon, Mo., has sent out a committee to visit other Missouri cities and investigate the advisability of installing a municipal electric-light plant.

A special city election will be held in Clarinda, Iowa, on January 18th, to vote on the proposition of granting a franchise to the Lee Electric Light Company to erect an electric-lighting plant.

The Georgetown Electric Company, with headquarters in Chicago, has been incorporated with a capital of $15,000. It is proposed to operate a heat, light and power plant. W. F. Brugman, A. M. Searle and C. C. Travis are the incorporators.

The El Paso Gas and Electric Company of El Paso, Texas, recently incorporated with a capital of $500,000, has completed organization by the election of the following-named officers: President, G. F. Goodnow of Waukegan, Ill.; vice-president and treasurer, C. H. Bosworth of Chicago; secretary, W. J. Cook; general manager, Thomas Jones. The company has purchased the plant of the El Paso Gas, Electric Light and Power Company, which it will improve.

First-mortgage gold bonds of the Louisville (Ky.) Lighting Company to the amount of $250,000, are being offered to investors. The bonds are a first and only lien on the entire property of the company now owner or that may be hereafter acquired. The Louisville Lighting Company is a consolidation of the Citizens' Lighting Company and the Louisville Electric Light Company, which owns all of the electric-light franchises in the city of Louisville, Ky., serving a population of about 230,000.

The City Council of Bangor, Maine, is considering the advisability of an effort before the state Legislature to secure the necessary power to enable the city to do a commercial electric-lighting, power and heat business. The city has at the waterworks dam an electric plant of its own, where is generated the current for all municipal lighting, and a great amount of power is running to waste which might be developed. The City Council has also voted to double the capacity of the municipal lighting plant and the waterworks at an expense of $10,000, and this will be done at once.

ELECTRIC RAILWAYS.

The Denver, Cliffside and Boulder electric road will be running cars between Boulder, Colo., and Denver by May 1st.

The Indian Territory Traction Company is now operating its electric railway between South McAlester and Dow, 14 miles.

W. E. Winner of Kansas City and others have been granted a franchise for the Sedalia and Warrensburg interurban electric railroad through Sedalia, Mo. The road will be 30 miles long.

A petition has been filed with the county commissioners at Glendive, Mont., by the Glendive and Lower Valley Rapid Transit Company for a franchise for a trolley line from Glendive to Buford, N. D. The road will be 80 miles in length.

Plans are under consideration for the construction of a new trolley road from the county line near Huntington, Long Island, to Flushing, which will touch the villages of Oyster Bay, East Norwich, Glen Cove, Sea Cliff, Roslyn, Mineola and Great Neck.

A new 56-foot trolley baggage car, equipped with four motors, and purchased by the Utica and Mohawk Valley Railroad Company at a cost of $10,000, was given a trial run between Rome and Ilion, N. Y., recently, and it covered the distance at an average rate of a mile a minute.

W. H. Powell and L. P. Andrews of Sedalia, Mo., and others are directors of the Sedalia Transit Company, which has been organized with a capital stock of $60,000, to absorb the Railway and Electric Company of Sedalia, and erect and operate an electric-lighting and street-railway plant.

Two electric-railway companies are about to petition the City Council of Alton, Ill., for a franchise to build electric lines in Belle Street. The rivals are the Alton, Granite and St. Louis Traction Company and the Central Traction Company of Jerseyville. Both have secured the signatures of many property owners in Alton.

It is announced that Murray Verner of Pittsburg has gone to St. Petersburg to have a special conference with the czar regarding a street-railway proposition which was made to Russia years ago, but which was blocked, it is said, by the late minister of the interior, Von Plehve. It is understood that the Russian government is now willing to talk business to the Pittsburg people.

Charles M. Swift of Detroit, Mich., president of the Manila Electric Railroad and Light Company, returned recently from the Philippines and stated that the electric railway being built by his company, and representing 40 miles of single track, would be completed by March 1st. The enterprise represents an outlay for construction and equipment of $4,000,000. The system lies within the city of Manila, excepting about four miles, which spans the distance to Malabon, a convenient suburb.

It is rumored that the Arkansas Valley Interurban Electric Company and the Kansas and Oklahoma Interurban Electric Company have merged. The foundation for the rumor is that the Arkansas Valley company has filed a $2,100,000 mortgage to secure bonds for construction. The mortgage is given the Equitable Trust Company and covers all the right-of-way, lands and franchises and the special franchises in the cities of Wichita, Wellington, Winfield and Arkansas City. The franchises of Winfield and Arkansas City are owned by the Kansas and Oklahoma company.

AUTOMOBILES.

The Automobile Battery Company has been incorporated at Santa Cruz, Cal., by Henry F. Kron and others, to make electric automobiles.

"The American automobile has come and conquered," says Mr. D. R. Birch, the United States Consul located at Malaga, Spain. "It must be considered a satisfaction for American automobile manufacturers to know that their machines have, in the fifth city of Spain, triumphed over the models of every other nation. There are now about a dozen automobiles in Malaga, half of which are of American build. Three more American cars are now en route and I believe that other orders are about to be placed."

SOCIETIES AND SCHOOLS.

The decision to form a Canadian street-railway association was arrived at recently when a meeting of representatives of the leading railways in Canada took place in Montreal. Up to the present time the leading companies in Canada have belonged to the American Street Railway Association.

S. E. Feddon, manager of the Sheffield Corporation electrical supply department, London, England, reports regarding his recent visit to Canada that he was very much impressed by the excellent planning of the electricity department of McGill University, Montreal. Referring to the Soulanges Canal electrical equipment, Mr. Feddon thinks that one of the best applications of electrical energy he has ever seen is embraced in this plant.

The Italian commissioner-general of the Louisiana Purchase Exposition has presented to the school of electric engineering at Purdue University a fine collection of charts, photographs and paintings that were on exhibition at the Palace of Electricity at the St. Louis Exposition. The collection shows the development of the electric power-transmission plants in Italy, and was presented to Purdue as an act of courtesy to Prof. W. E. Goldsborough.

Mr. Homer E. Niesz, editor of the Question Box for the Denver-Colorado Springs meeting of the National Electric Light Association, has sent out over 7,000 letters to companies and individuals in the electrical field asking them to submit questions, grouped under 27 different headings, relating to central-station plants and their operation. Mr. Niesz not only desires questions from those seeking information, but he appeals to the missionary spirit in those who have solved difficulties for themselves and asks them to send questions to which they have found solutions, together with the replies, for the benefit of others. There is practically no limit to the benefits to be gained through this interchange of knowledge.

POWER TRANSMISSION.

John Boyd will erect and install a 750-horsepower electric plant for the Palmer Mountain Tunnel Company at Loomis, Wash.

The Utah Light and Power Company will soon install another power plant in American Fork Canyon, Utah. John W. Wootton of American Fork, Utah, is manager.

The Spring River Power Company has completed its dam at Galena, Kan., which is to furnish 5,500 horsepower to its electric plant. Power will be furnished the mines, etc.

The Carolina Water, Light and Power Company has been incorporated at Marion, S. C., with a capital of $250,000. J. W. Johnson and W. J. Montgomery are the incorporators. It is proposed to generate electricity by waterpower for lighting and power purposes.

PUBLICATIONS.

A mailing card from the F. Bissell Company of Toledo, Ohio, serves as a reminder that Jandus interchangeable arc lamps are still at the front. More cards of a similar nature are to follow, therefore, preserve this, says the company.

The Automatic Electric Company of Chicago has published in pamphlet form a technical description of its automatic telephone system, written by Mr. Fritz Lubberger, one of the engineers of the company. This pamphlet will be sent to interested persons on inquiry.

The Williams Electric Machine Company of Akron, Ohio, manufacturer of electric clutches and safety devices, clutch pulleys, etc., has issued a new catalogue upon this apparatus which is striking in appearance and well worthy of preservation on account of the tables for every-day use which it contains. The apparatus is illustrated in a pleasing manner and ample descriptive matter accompanies each picture. The catalogue is well prepared.

In looking over the latest catalogue of the Marinette Gas Engine Company of Chicago Heights, Ill., the first thing which claims the attention is the pleasing design of the cover. Upon opening the book it is found that the interior shows the good taste which is characteristic of the outside. Typographically, the whole is well executed, and when it comes to the matter of the descriptions and illustrations of the various types of gas engines which this company manufactures, very little has been left unsaid in the 48 pages which the catalogue contains.

TELEGRAPH.

A destructive fire in Sioux City, Iowa, a few days ago burned two business blocks. The office of the Western Union Telegraph Company was among the buildings burned. The wires of both telegraph companies were lost, cutting off the city from outside communication. The loss is estimated at $2,000,000.

The telegraph lines which have been taken over by the civil government from the military administration in the Philippine Islands, are under the control of the Philippine constabulary. During the year some 20 telegraphers have been appointed by this bureau in the United States and transported to the islands. It is the policy of the Philippine government, however, eventually to employ Filipinos as telegraph operators as soon as they are qualified, and for this purpose telegraphic schools have been established in Manila and some of the larger cities for the purpose of training natives along this line.

SPACE TELEGRAPHY.

The Mallory Line steamships San Jacinto and Denver have been equipped with wireless-telegraph apparatus. The De Forest system is used. The De Forest company is preparing to equip the entire Mallory fleet, it is said.

Experiments with the Artons system of space telegraphy have been made between Rome and Sardinia, resulting, it is said, in an alleged successful demonstration of the inventor's claim that an electromagnetic-wave message transmitted by this system cannot be diverted from the point for which it is intended. King Victor Emmanuel witnessed the test.

A dispatch from Paris says that a 50-word wireless telegram sent over the Alps from Cornwall to Italy recently arrived without a mistake in the wording, despite the fears that the rarefied atmosphere of the higher Alps would affect the message. The message was first received at Lausanne, then at the station on the top of Monterosa, whence it was transmitted direct to Ancona.

A contract has been signed with a United States company at Bocas del Toro, Panama, for the establishment of a system of space telegraphy between

Bocas del Toro and Colon on the one hand and Bocas del Toro and Port Limon, in Costa Rica, on the other, the latter thus affording communication with foreign countries by way of Central America. Also a similar system connecting Colon with Panama, and thence with the republics in South America.

MISCELLANEOUS.

When a fire alarm came to one of the engine companies in Burlington, N. J., at a time when there were only five firemen in the house, two of the resourceful men hitched the horses to the engine, while the other three seized the hose carriage, attached it to the rear of a trolley car which was passing and arrived at the scene of the conflagration in record time.

The Criminal Court of the Seine has convicted the four trainmen who were responsible for the catastrophe on the Metropolitan electric underground railroad in Paris in August, 1903, resulting in the loss of 65 lives. The conductor and station superintendent were sentenced to a month's imprisonment and a $400 fine each, while two motormen, who were permanently injured, were released with fines of $600 and $400, respectively.

The executive committee of local No. 68 of the union of electrical workers, in Denver is arranging for a public entertainment that will be something different from anything ever before attempted in the city. The entertainment in question will consist of a demonstrative lecture on "Electricity; Its Properties, Uses and Powers." There will be shown and illustrated with mechanical appliances the field of electrical research. There will be the entire working apparatus for space telegraphy, wireless telephones, wireless electric lighting, static illuminations, high-frequency currents and wireless exelaphone.

A decision has been rendered by the commissioner of patents to the effect that a specification for a patent should be confined to a description of the structure of the device and the manner of its use, and a discussion of the theoretical result to be attained by the use of the invention. When matter of an advertising nature is incorporated in the specification, yet the description of the mechanical structure and manner of use is clear, it is held that action on the merits should be proceeded with, but that the matter in the specification which is of an advertising nature should be required to be erased before the patent is allowed.

When the gases pass through an economizer containing pipes arranged longitudinally in straight rows with intervening straight free air spaces, they do not come into contact with a large part of each pipe; in other words, they are not sufficiently agitated by the pipes. In fact, there is always a considerable amount of gas which passes quickly through the openings between the rows of pipes without giving up any appreciable heat until it joins with the colder gases at the economizer outlet. The patent arrangement of "staggered pipes" in the Sturtevant economizers, in which the several sections are so arranged that the pipes of any one section stand longitudinally opposite the spaces between the pipes of the adjoining sections, overcomes this loss of heat. With this arrangement the gases are agitated and come into contact with a maximum area of the economizer pipes, utilizing a maximum amount of the waste heat from the boiler.

TRADE NEWS.

The Bureau of Supplies and Accounts, Navy Department, is inviting sealed proposals until January 10th for furnishing the navy yards at Boston, New York, Newport, Norfolk, League Island and elsewhere, with a quantity of motors, arc lamps, panel boards, wire and lamp cord, circuit-breakers, dry-battery cells, battery boxes and miscellaneous electrical supplies. Specifications and blank proposals can be obtained of the bureau or at the navy pay offices in the cities mentioned.

Two suits have been filed entitled Edison Electric Light Company versus Tri-city Electric Company and General Electric Company versus Tri-city Electric Company for infringement, respectively, of patents No. 444,530 to Edison, and No. 532,760 to Branin. The defendant, in business in Davenport, Iowa, is sued for dealing in lamps infringing these patents. The suits were commenced on December 19, 1904.

Leroy W. Stanton, consulting telephone engineer, Electric Building, Cleveland, is enthusiastic over the prospect for business during the coming year. Mr. Stanton is now installing two "open wireless" telephone plants. In each of these plants there will be employed from 100,000 to 200,000 feet of cable. Mr. Stanton reports a number of telephone plants to be commenced as soon as the spring weather opens up. In establishing his staff, Mr. Stanton has availed himself of the services of some of the best engineering talent to be found among the large Bell and fndependent companies.

BUSINESS.

The Pardridge Shade and Reflector Company, Chicago, reports that patents for its "Easy" cord adjuster have just been allowed in Germany. Mr. A. J. Pardridge, president of the company, with Mrs. Pardridge, is leaving for a four-month sojourn in southern California.

Frederick W. Leonard, referee in bankruptcy of the Standard Pole and Tie Company, gives notice that on January 5th, at his office in Newark, N. J., his application will be considered for an order allowing him to sell at public sale all the personal property of the company.

After two years of experimentation, the Cleveland Electric Railway Company has decided upon the individual air-brake compressor system and has just placed what is said to be the largest order ever secured in this country for such apparatus with the National Electric Company of Milwaukee.

The Faries Manufacturing Company of Decatur, Ill., manufacturer of the Faries line of fixtures, states that the business of the company has not failed to show an increase each year over the previous one. This year's business has exceeded any former year's by a good margin and the company feels satisfied that this increase will be maintained the coming year.

James B. Day & Co. have recently completed a new factory in Chicago at No. 57 Illinois Street for the manufacture of shellac varnishes, lacquers, etc. The company is manufacturing a special line of lamp lacquers for which a new department has been established. These lacquers are made in various shades and allow of dipping either hot or cold, producing, it is said, a permanent coloring. The main offices of the company are at No. 49 West Lake Street.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued (United States Patent Office) December 20, 1904.

777,666. Cluster Socket. John H. Dale, New York, N. Y. Original application filed February 18, 1904. Divided and this application filed April 5, 1904.

A cluster socket comprises a finishing cap or casing provided with openings for lamps. Lamp-holding devices and contacts in the cap or casing engage with the lamps.

777,677. Automatic Gas Danger Signal. Preston A. Kettering, Cadiz, Ohio. Application filed February 16, 1904.

Means for indicating the reduction of pressure within a pipe consist of a tube, a weight movable within the tube and supported by the pressure under normal conditions, and an electric alarm circuit adapted to be closed by and through the weight when the pressure falls below that sufficient to support the weight.

777,691. Trolley Head. Edwin V. Newcomb, Kansas City, Mo. Application filed December 15, 1903.

Bearing-recesses in the trolley harp are provided at corresponding ends with entrance slots and with bearing blocks within the other corresponding ends of the recesses, the blocks being capable of adjustment therein across the entrance slots.

777,693. Electric Locomotive. Edward D. Priest, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed May 6, 1904.

An electrically propelled vehicle embodies a control system for the motors of the vehicle which includes resistance sections, a compartment in which the resistance sections are located and a sand-box in the compartment so arranged as to be subjected to the heat from the resistance sections.

777,698. Trolley Head and Wheel. Joseph W. Sharp, Mohawk, N. Y. Application filed March 4, 1904.

Details are described.

777,707. Insulated Joint. George A. Weber and Percy Holbrook, New York, N. Y., assignors to the Weber Railway Joint Manufacturing Company, New York, N. Y. Application filed November 13, 1903.

A shoe at the ends of the rails is made in the form of a channel in which the rails rest, being separated from the channel by insulating material.

777,741. Base for Electric Lamp Bulbs. George P. McDonnell, St. Louis, Mo. Application filed March 12, 1904.

A ring adapted to be passed about the neck of the bulb carries a plug for entering the hollow stem of the bulb.

777,750. Apparatus for Indicating the Magnetic Condition of Heating Metals. George W. Sargent, Reading, Pa., assignor to the Carpenter Steel Company, Reading, Pa. Application filed July 11, 1904.

Combined with a metal-heating apparatus are a magnet arranged to include in its field the metal to be heated, means for indicating the response or non-response of the metal to the magnetic influence and means for protecting the magnet from the heating action.

777,759. Apparatus for Automatically Starting Electromotors and for Regulating Purposes. Johan J. Thoresen, Bygdö, Norway. Application filed December 2, 1902.

In an apparatus for automatically starting electromotors and for regulating purposes are a rotating part and one or more chambers formed in it and containing a powdered or granulated resistance material. Conductors are in contact with separate parts of the material.

777,760. Automatic Signal System. John R. Walsh, Boston, Mass., assignor of one-half to Henry T. Goold, Lexington, Mass. Application filed February 19, 1904.

Several circuits each include a sign in a central station. A circuit-closer and a circuit-opener are combined with a tappet on a car to engage successively the circuit-closer and the circuit-opener in any one circuit.

777,764. Telephone Call Register and Time Indicator. David A. Yoder, Toledo, Ohio. Application filed April 27, 1904.

A call register and indicator for telephones embodies a motor-operated driver, a series of time-indicating mechanisms adapted to be driven thereby, a series of counters, one for each time-indicating mechanism, electromagnets for establishing driving connection between the time-indicating mechanism and driver and a call or operator's circuit controlling each of the magnets.

777,778. System for Controlling Electric Motors. Henry H. Cutler, Milwaukee, Wis., assignor to the Cutler-Hammer Manufacturing Company, Milwaukee, Wis. Application filed July 6, 1903.

Connected in a number of controlling circuits are electromagnetic windings adapted to respond to variations of voltage. A separate source of supply is provided for each of the circuits, and means for simultaneously varying at will the voltage impressed upon each of the circuits.

777,801. Electric Switch. William J. Murray, Leavenworth, Kan., assignor of one-half to Herbert W. Wolcott, Leavenworth, Kan. Application filed May 2, 1904.

Contact-posts, a contact-arm pivoted at a point between the vertical planes containing the axes of the posts, a lift plate to oscillate the arm from one post toward the other and means for yieldingly resisting the first part of the movement of the arm and then for continuing the movement until the arm contacts with the other post are the essential features of the switch.

777,807. Telephone System and Apparatus. Elias E. Ries, New York, N. Y. Application filed June 23, 1899.

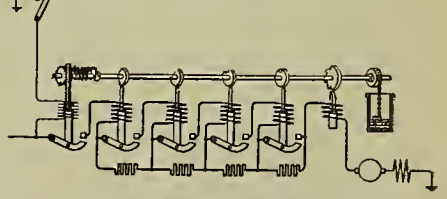
In a telephone-exchange system having a clearing-out drop connected across the cord-circuit are a grounded generator connected to the circuit at the central office and a telephone receiver at the subscriber's station embodying an automatic gravity switch adapted when held to the ear to connect the two sides of the line and to complete a ground connection when the instrument is placed in its normal position.

777,808. Telephone Transmitter. Elias E. Ries, New York, N. Y. Application filed June 23, 1900.

An improved method of producing variations of resistance in an electric circuit corresponding in form to sound-waves, consists in varying the extent of a wetted surface included in an electric circuit with the wetting liquid by the principle of capillary action.

777,833. Static Electrical Machine. Charles F. Birtman, Chicago, Ill. Application filed February 6, 1904.

A static electrical machine comprises two disk-like members mounted for relative movement and having parallel surfaces provided at opposite peripheral sides with devices adapted for reciprocal operation for the generation and collection of electricity.



NO. 777,839 —MOTOR STARTER.

777,839. Motor Starter. Eugene R. Carichoff, East Orange, N. J., assignor to the General Electric Company, Schenectady, N. Y. Application filed May 12, 1904.

Several separately actuated contacts control the motor circuit. Actuating coils for the contacts are successively connected in the controlled circuit, each by the operation of the contact next in advance, to produce an automatic progression of the contacts. Independently operated means regulate the progressive closing of the contact and a switch primarily completes the controlled circuit. (See cut.)

777,844. Meter. Frank P. Cox and William H. Pratt, Lynn, Mass., assignors to the General Electric Company, Schenectady, N. Y. Application filed January 29, 1903.

A movable measuring element is associated with a number of conductors and means responsive to the flow of direct current in one of the conductors for moving the element. Means responsive to the flow of alternating current in another of the conductors also move the element.

777,851. Electric Battery. William H. Gregory, Vallejo, Cal. Application filed May 14, 1904.

Combined with the cell of a dry battery is a breakable liquid-holding tube containing an auxiliary supply of liquid arranged therein for resupplying moisture.

777,857. Dynamo for Train Lighting. James F. McElroy, Albany, N. Y., assignor to the Consolidated Car Heating Company. Original application filed June 6, 1902. Divided and this application filed September 2, 1904.

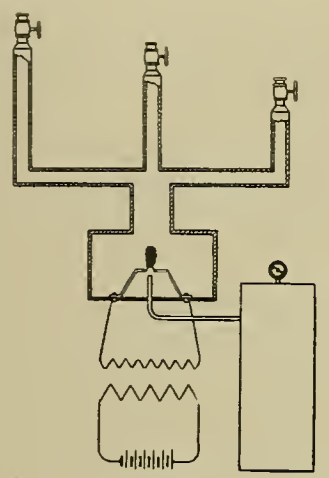
A generator for car-lighting embodies a field-magnet, a casing forming the yoke of the magnet and inclosing the machine, a partition in the casing surrounding the dynamo shaft, an armature on the shaft on one side of the partition, an automatic switch on the opposite side of the partition, and operating devices controlled by the shaft and controlling the switch.

777,866. System of Distribution. John B. Taylor, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed May 21, 1904.

In an electrical system of distribution are sections separately connected to the source or sources, and automatic switches adapted and arranged to connect the sections to each other when the sections are energized.

777,871. System for Lighting Hydrocarbon Lamps. George Washington, New York, N. Y., assignor to Joseph N. Patterson, Devon, Pa. Application filed August 3, 1899.

Electric sparking mechanism is used to ignite the carburetted air.



NO. 777, 988.—ELECTRIC PROCESS OF GENERATING GASES.

777,883. Control System. Eugene R. Carichoff, East Orange, N. J., assignor to the General Electric Company, Schenectady, N. Y. Application filed June 2, 1904.

Normally open switches are provided with means for closing each. A controlling device is arranged to be placed successively under strain by the closing of each switch and adapted by its movement to actuate successively the closing means of the remaining switches, and there are means for retarding the movement of the device.

777,888. Automatic Fire Extinguishing Apparatus. James Fiddes, Aberdeen, Scotland. Application filed February 1, 1904.

An electromagnet is included in an alarm circuit which is automatically closed when the automatic sprinkling system is put into operation.

777,912. Trolley Crossing. Edward R. North, Webster Groves, Mo. Application filed May 6, 1904.

An electromagnet operates the bridge connecting the two branches of a trolley line.

777,954. Telephone Chair. George J. Just, Northbranch, Iowa. Application filed August 15, 1902.

Concealed circuits in the chair arm lead to a telephone mounted conveniently to the ear.

777,971. High-speed Train System and Apparatus Therefor. Thomas H. Patenall, Wilkinsburg, Pa., assignor to the Union Switch and Signal Company, Swissvale, Pa. Application filed April 7, 1902.

A high-speed train-staff system comprises a call-circuit, main and local circuits, locking magnets, an armature and mechanism adapted to lift the armature to the locking magnets, the armature being held up when the magnets are energized so as to act conjointly. A staff lock is controlled by the magnets.

777,972. High-speed Permissive-train System and Apparatus Therefor. Thomas H. Patenall, Wilkinsburg, Pa., assignor to the Union Switch and Signal Company, Swissvale, Pa. Application filed September 19, 1902.

A high-speed train-staff instrument having a permissive staff, an electrically controlled lock for the staff, a tablet-receptacle and lock is arranged so that the permissive staff unlocks the receptacle. The withdrawal and manipulation of the permissive staff is controlled by electric circuits connecting it with a distant instrument.

777,974. Electromotive Device for Clocks. David Perret, Neuchâtel, Switzerland. Application filed May 27, 1904.

In an electric motive device for clocks and similar mechanisms are a ratchet wheel, an electrically connected spring contact, and a double-armed click, the shorter arm of which normally engages the ratchet wheel, while the longer arm engages the spring contact.

777,985. Battery. Nelson M. Watson, Detroit, Mich. Application filed June 13, 1904.

Details are described.

777,987. Apparatus for the Treatment of Gases. Ernest E. Werner, St. Louis, Mo., assignor to the Electrical Purifying Company. Application filed June 13, 1904.

Apparatus for treating gases comprises an inclosed chamber having suitable inlets and outlets, electric terminals in the chamber, means for supplying current to the terminals, means for supplying gas under pressure to the action of the arc between the terminals and means for regulating the escape of gas from the chamber.

777,988. Process of Generating Gases from the Atmosphere. Ernest E. Werner, St. Louis, Mo., assignor to the Electrical Purifying Company, Stafford, Kan. Application filed August 6, 1904.

The process, which consists in generating gases from air by maintaining an arc between two electric terminals in a chamber, allows compressed air to be released and expanded in the gap between the terminals and regulates the volume of compressed air released by varying the outflow of the treated gases. (See cut.)

777,989 and 777,990. Apparatus for the Treatment of Gases. Ernest E. Werner, St. Louis, Mo., assignor to the Electrical Purifying Company, Stafford, Kan. Original application filed June 13, 1904. Divided and these applications filed August 11, 1904.

These two patents refer to apparatus by which gases are treated by submitting them to the action of an electric arc.

777,991. Device for Projecting Air Against Electric Discharges. Ernest E. Werner, St. Louis, Mo., assignor to the Electrical Purifying Company, Stafford, Kan. Application filed August 29, 1904.

Combined with electric arc terminals is a device for projecting compressed air in divided streams against the side of the arc.

778,005. Electric Insulator. Charles Booker, Toronto, Canada. Application filed February 1, 1904.

Combined with a hood of insulating material provided with a cylindrical hole and a pin fitting therein are a spring, means for holding the pin within the hole, and a resilient washer between the top of the pin and the top of the hole, so as to take up any slack in the spring connection.

778,017. Trolley Guard. Mack H. Dorsey, Woodlawn, Ala. Application filed May 24, 1904.

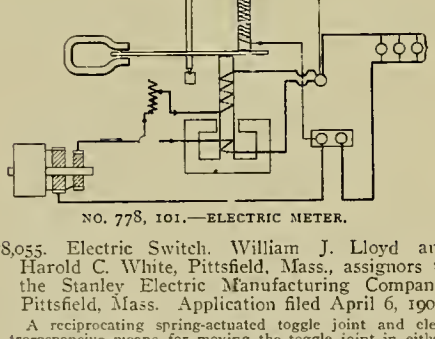
Inwardly turned retaining fingers form the trolley guard.

778,021. Electromagnetic Apparatus for Operating Reciprocating Mechanisms. Joseph Feingold, Frankfort-on-the-Main, Germany. Application filed June 21, 1904.

In an electromagnet driving apparatus for hammers, punching-machines, pumps and the like are movable electromagnet coils provided with cores passing into fixed electromagnet coils with a transverse iron bar connecting the cores.

778,037. Signaling Mechanism. Reinhold Herman, Crafton, Pa. Application filed November 21, 1903.

Electrically-controlled operating mechanism consists of a motor for actuating the mechanism, an inclosing box or casing for the mechanism and motor, and provided with a lens opening, a supporting-post on which the box or casing is mounted, the drive-shaft of the mechanism extending through the box or casing, a signal mounted on the drive-shaft outside the casing, and electrically controlled means for locking the signal in danger position.



NO. 778, 101.—ELECTRIC METER.

778,055. Electric Switch. William J. Lloyd and Harold C. White, Pittsfield, Mass., assignors to the Stanley Electric Manufacturing Company, Pittsfield, Mass. Application filed April 6, 1903.

A reciprocating spring-actuated toggle joint and electroresponsive means for moving the toggle joint in either direction from its dead-center are associated with a switch mechanism adapted to be operated by the movement of the toggle-joint in either direction from its dead center.

778,067. Telegraphic Key. John E. Pearson, Motor, N. C. Application filed November 12, 1903.

Mechanical parts are set forth in the patent.

778,101. Electricity Meter. Arthur Blanchet, Paris, France, assignor to Compagnie pour la Fabrication des Compteurs and Matériel d'Usines a'Gaz, Paris, France. Application filed October 19, 1903.

In a rotary field or induction meter the shunt energized flux is displaced less than a fourth of a period with respect to the active electromotive force. A differential flux produced by two components of the main current, one of which traverses a path of low self-induction and the other a path of high self-induction, produces a resultant flux displaced a fourth of a period with respect to the flux of the shunt current. A rotable armature is acted upon by the fluxes, the speed of the armature being proportional to the current to be recorded. (See cut.)

778,120. Multiplex Telegraphy. Thomas B. Dixon, New York, N. Y. Application filed October 11, 1898. Renewed May 16, 1904.

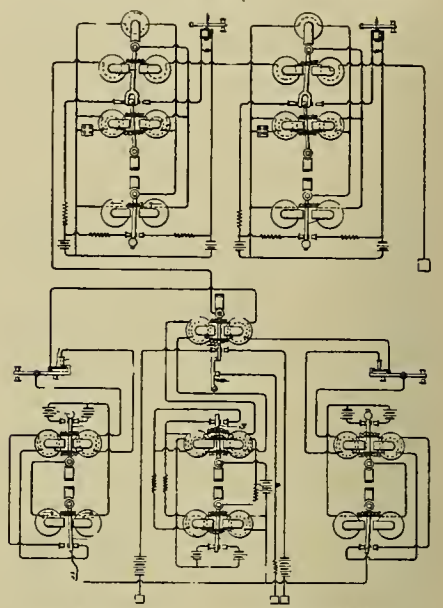
Associated with the line conductor are means for supplying to the line currents of two different directions. Two double-current transmitting instruments are provided, one for each direction of line-current. A selector and two single-direction double-current receiving instruments, one operated only by positive currents, and the other only by negative currents, and each adapted to be changed from, and restored to, normal condition, by alternate current impulses of proper direction in the line complete the apparatus. (See cut.)

778,146. Gas-engine Ignition Dynamo. John Reek, Camden, Mich., assignor to the Alamo Manufacturing Company, Hillsdale, Mich. Application filed March 16, 1903.

A small dynamo for furnishing the spark for gas engine is described.

778,155. Incandescent Electric Lamp and Switch. George Sweetser, Upper Norwood, England, assignor to E. C. L. Syndicate, London, England. Application filed February 2, 1904.

A light-emitting member which is a non-conductor when cold and a heat-emitting member which is a conductor at ordinary atmospheric temperatures and which is in circuit and electrically connected intermediate of its ends to one end of the light-emitting member are the two essentials of the lamp.



NO. 778, 120.—MULTIPLEX TELEGRAPH SYSTEM.

778,177. Telegraphy. Thomas B. Dixon, New York, N. Y. Original application filed October 11, 1898. Divided and this application filed April 22, 1902.

Transmitting apparatus for simultaneously telegraphing messages in the same direction, through a single circuit, allows the transmitting of the signals of each message by current impulses occurring in pairs, one at the beginning and the other at the end of each signal, the signals of one message being transmitted by positive impulses and the signals of the other message by negative impulses.

778,194. Electric Furnace. Henry M. Howe, New York, N. Y., assignor to Eimer & Amend, New York, N. Y. Application filed October 3, 1902.

An electric resistance furnace consists of two internally grooved blocks and a cover in combination with a resistance element in the grooves of the blocks.

778,206. Electric Hammer. William F. Wagner, New York, N. Y. Application filed July 11, 1904.

An electric hammer comprising a suitable casing is arranged to reciprocate within a casing. Electromagnet coils operate the hammer and a demagnetizing coil releases it.

EXPIRING PATENTS.

Following is a list of electrical patents (issued by the United States Patent Office) that expired on December 27, 1904:

375,328. Commutator or Electric Circuit-breaker. C. D. Baker, Chicago, Ill.
375,339. System of Synchronism for Telegraphy. G. A. Cassagnes, Paris, France.
375,346. Electrically Propelled Vehicle. S. D. Field, Yonkers, N. Y.
375,390. Portable Electric Coal-mining Machine. J. B. Sneathen and A. Micheals, Pittsburg, and M. A. Micheals, Allegheny, Pa.
375,392. Electric Meter. W. A. Stern, Allegheny City, Pa.
375,408. Caleletric Generator. E. G. Acheson, Pittsburg, Pa.
375,414. System of Electric Gas Lighting. W. H. Doering, Philadelphia, Pa.
375,441. Galvanic Battery. H. B. Cox, Cincinnati, Ohio.
375,456. Telephone. E. C. Newton, Little Rock, Ark.
375,476. Electrical Cut-out Device. J. Chester Chamberlain, New York, N. Y.
375,542. Electrical Converter, Motor and Generator. R. Eickemeyer, Yonkers, N. Y.
375,543. Electric Circuit-changing and Signaling Apparatus. I. H. Farnham, Malden, Mass.
375,544. Electromagnetic Arresting and Releasing Mechanism. I. H. Farnham, Malden, Mass.
375,559. Galvanic Battery. James F. McLaughlin, Philadelphia, Pa.
375,560. Electric Motor. James F. McLaughlin, Philadelphia, Pa.
375,561. Primary Electric Battery. James F. McLaughlin, Philadelphia, Pa.
375,617. Electric Call Box. L. B. Firman, Chicago, Ill.
375,633. Underground Electric Conductors. De Witt C. James, Warren, Pa.
375,636. Fire Extinguisher and Alarm. C. E. Kells, Jr., New Orleans, La.
375,637. Burglar Alarm. D. H. Kime, Kendallville, Ind.
375,676. Electric Motor. E. Julien, Brussels, Belgium.
375,685. Double Spring Loop Key and Circuit for Multiple Switchboards. C. E. Scribner, Chicago, Ill.
375,697. Tension Device for Winding Electromagnets. J. W. Easton, New York, N. Y.

IMPORTANT NOTICE

AMERICAN CIRCULAR LOOM CO.
TRADE MARK
REGISTERED
MANUFACTURERS OF
FLEXIBLE INTERIOR CONDUIT
CANVAS JACKETS FOR INSULATED WIRE & CABLES
AND
TRADE
—ELECTRODUCT—
MARK

Chelsea, Mass., July 2nd, 1904.

Gentlemen:

Our attention has been called to certain reports that have been recently circulated, evidently with malicious intent with reference to an alleged action of the Underwriters in condemning "Circular Loom." We cannot believe that any of our trade will be misled by these libelous statements. But, may we not ask that you kindly refer to the list of approved appliances published by the Underwriters, April, 1904, in which you will find our material has the full sanction of the Bureau? All appliances included in this little pamphlet are recommended for use by the Underwriters and it will be apparent to you that our name would not be upon its pages unless "Circular Loom" met the requirements.

We have recently taken this matter up with the Bureau and have been assured that our material has not been condemned and that when installed in conformity with the rules laid down by the national code, it is accepted by the various bureaus throughout the United States, and ***in verification of this statement you are at liberty to communicate with the Electrical Bureau of the National Board of Fire Underwriters, 67 East 21st St., Chicago.***

Yours very truly,

AMERICAN CIRCULAR LOOM CO.

DO YOU WANT THE BEST?
Then ALWAYS buy
THE MAXSTADT PATENT JOINT
Manufactured and sold by the owners of the Maxstadt Patent No. 655,905.
This is the best Joint on the market and gives entire satisfaction wherever used.
No. 882 represents the Joint ready for use.
Patented August 14, 1900, in the United States and Foreign Countries.

No. 882.
No. 884 represents the Joint, twisted, complete on the line.

No. 884.
These Joints are furnished in copper for copper wire and in tinned steel for galvanized iron wire. Samples and prices will be sent, without charge, upon request.
SOLE OWNERS OF THE MAXSTADT PATENT IMPROVED AMERICAN JOINT.
CHICAGO DIE & ELECTRIC COMPANY, 87-91 West Lake Street, CHICAGO, ILL.

EDWARDS AND CO
The R. E.-A. L. Monitor Bell.
(Patented.)

Hammer rod supported in two places and thrown straight out and in by the armature, striking gong on inside, near edge, thus giving a full, clear tone.
All springs made of Phosphor Bronze and so formed that there is least possible strain.
Contacts are platinized, adjustment is made by pressure on the standard which supports one contact. No screws or nuts being used in the adjustment, bell does not get out of order by operation.
Ordinarily the weak point is the pivot, the unreliable one the adjusting screw and nut. As these defects have been eliminated, this bell will stand hard usage and operate under adverse conditions.
The hammer entirely concealed by gong and cannot be tampered with.
It is especially adapted for use on street cars, as in addition to the advantages mentioned, it is dust, insect and moisture proof.

BITUMINIZED FIBRE CONDUIT
FOR
ELECTRICAL UNDERGROUND CONSTRUCTION
ELECTROLYSIS PROOF WATER PROOF

A smooth laminated insulator of unchanging durability.
Forms a continuous sealed duct from manhole to manhole, impervious to moisture and through which leaking gas cannot penetrate.
There has never been a gas explosion in our conduits nor the slightest evidence of electrolysis.
Abrasion of the cables is an impossibility.
It saves sixty per centum of freight and handling cost and twenty to thirty-five per centum of construction.
Process of laying is simple, rapid and inexpensive. There is no loss from breakage or fitting. It is self-aligning and cannot settle out of alignment.
All sizes from one inch to ten inches interior diameter. Bends of all angles.
The foremost electrical engineers are recognizing and testifying to the scientific advantages of our system of subway construction over all previous methods.

Send for illustrated book. Ask for prices giving size and quantities required

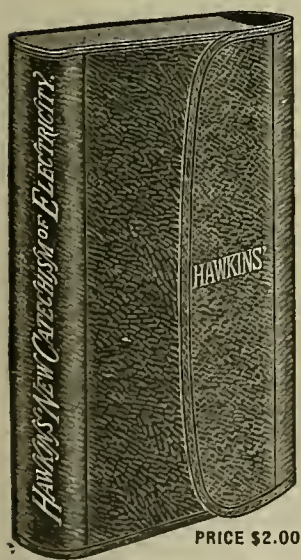
HAWKINS' NEW CATECHISM OF ELECTRICITY.

Plan of the Work, Contents, Etc.



PRICE $2.00.

The New Catechism of Electricity will be found to be surprisingly plain, and free from useless and ambiguous terms. The plan upon which it is arranged is unique.

The book is, first of all, intended to be plain and instructive; some 300 illustrations have been introduced, so that the mere pictures will afford almost a knowledge of the subjects.

It is a school book from the manner in which it proceeds from the simple facts to the abstract principles which the facts indicate; it is also a book of reference through the index of seventeen double columns of fine type pages; by means of this index a thousand items of practical importance are at once available.

It is an up-to-date work, which has cost a large outlay of capital and time, and, in short, it is doubtful if any more attractive book has ever been issued—or one more useful.

The subjects treated upon are as follows: Dedication to Thomas A. Edison, with engraving of Mr. Edison; Preface and Introduction; Nature and Source of Electricity and Magnetism.

The Dynamo; Conductors and Non-Conductors; Symbols, abbreviations and definitions relating to electricity; Parts of the Dynamo; The Motor; The Care and Management of the Dynamo and Motor.

Electric Lighting; Wiring; The rules and requirements of the National Board of Underwriters in full; Electrical Measurements.

The Electric Railway; Line Work; Instruction and Cautions for Linemen and the Dynamo Room; Storage Batteries; Care and Management of the Street Car Motor; Electro Plating.

The Telephone and Telegraph; The Electric Elevator; Accidents and Emergencies, etc., etc.

The full one-third part of the whole work has been devoted to the explanation and illustrations of the dynamo, and particular directions relating to its care and management;—all the directions are given in the simplest and most kindly way to assist rather than confuse the learner. The names of the various parts of the machine are also given with pictorial illustrations of the same.

In the Catechism no less than 25 full page illustrations have been given of the various dynamo machines made in different parts of the country, and an equal number of part page illustrations.

WATTMETERS FOR DIRECT CURRENTS

The new Duncan has all the up-to-date features that go to make it the best on the market. It will pay you to try one and investigate its merits for yourself.

Its multipoint switch method of compensating for friction and vibration is conceded to be the simplest, quickest and most reliable means yet devised. It is superior in every respect to the old and clumsy methods of adjusting the compensating coil bodily and is not damaged by lightning.

Crocker-Wheeler. Brown, Boveri.

By arrangement with the celebrated electrical engineers, Brown, Boveri & Cie. of Baden, Switzerland, the Crocker - Wheeler Company has secured their alternating current designs, patents and rights to manufacture in America, and has retained them as consulting engineers.

Crocker-Wheeler Company is now putting on the market alternating current generators, transformers and accessories of the most perfect design and construction, adapted to American practice. Opportunities to bid on this apparatus are invited.

HORNBERGER-IRWIN

Transformers

(LARGE AND SMALL)

½ K. W. to 500 K. W.

This transformer represents the latest improvements in transformer construction; made in three types; multi-coil construction; ventilated cores; built for all commercial voltages and frequencies; **higher efficiencies together with lower temperatures than have heretofore been attained are guaranteed.**

Catalogue just issued explains details.

READ THE BLUE ELECTRICAL PAPER.

The Electro-Magnet
—BY—
TOWNSEND WOLCOTT, A. E. KENNELLY, RICHARD VARLEY.
PRICE, ONE DOLLAR,
CONTENTS.
General Properties. Magnetic Field of Force. Magnetic Units. Induced Magnet, Reluctance, Permeability. Discovery of Electro-Magnetism. Iron Ring in the Magnetic Field. Calculation of Magnet Windings. Magnetic Circuit. Given Ampere-Turns to Find Proper Current. Relation of Ampere-Turns to Wire Space. Room Occupied by Insulation. Heating and Other Limiting Conditions. Winding a Magnet for a Given Voltage. Hysteresis, Self-Induction. Alternating Currents. Traction.
On the Relative Values of the Windings of Electro-Magnetic Coils. Properties of Fixed Winding Spaces and a Fixed Size of Wire. Properties of Fixed Winding Space and Variable Size of Wire. Fixed Winding Space and Fixed Length of Wire or Number of Turns. Constant Internal Dimensions, but External Diameter of Coil Variable. Fixed Internal Radius and Interflange-Fixed Number of Turns of Same Size of Wire.
The Importance of Details. Actual Calculations. Working Formulæ. Diameter of Wire to Carry Given Current. Diameter of Wire to Have Given Resistance. Thickness of Insulation in a Given Coil. Weight of Copper in a Given Coil. Table of Constants for Insulated Wire. Standard Table of Resistances of Insulated Wires. Table Showing Percentage of Copper and Insulation in Cotton or Silk Covered Wire. Standard Copper Wire Table. 17 Problems (Solved) Illustrated. Cuts of 37 Magnets of Standard Dimensions, Lengths Variable. Logarithms and Anti-Logarithms. Decimal Parts of an Inch. Logarithmic Scale.

BITUMINIZED FIBRE CONDUIT

FOR

ELECTRICAL UNDERGROUND CONSTRUCTION
ELECTROLYSIS PROOF WATER PROOF

A smooth laminated insulator of unchanging durability.

Forms a continuous sealed duct from manhole to manhole, impervious to moisture and through which leaking gas cannot penetrate.

There has never been a gas explosion in our conduits nor the slightest evidence of electrolysis.

Abrasion of the cables is an impossibility.

It saves sixty per centum of freight and handling cost and twenty to thirty-five per centum of construction.

Process of laying is simple, rapid and inexpensive. There is no loss from breakage or fitting. It is self-aligning and cannot settle out of alignment.

All sizes from one inch to ten inches interior diameter. Bends of all angles.

The foremost electrical engineers are recognizing and testifying to the scientific advantages of our system of subway construction over all previous methods.

Send for illustrated book. Ask for prices giving size and quantities required

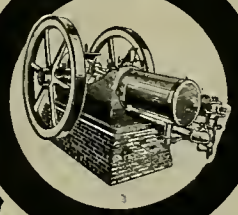
FIBRE-GRAPHITE COMMUTATOR BRUSH SELF-LUBRICATING

There's No Friction

with the Fibre-Graphite Commutator Brush. Being 90 per cent. pure graphite, it insures low resistance, no sparking under a varying load, and longer wear. There is no greasing required. The Fibre-Graphite is therefore the most economic brush on the market. Send for price list.

HOLMES FIBRE-GRAPHITE MFG. CO. 5155 Wakefield St., Germantown, PHILADELPHIA.



Olds Gas and Gasoline Engines

When gasoline is used for fuel it can be pumped up only as fast as it is used. Perfect mechanical appliances make for absolute safety and economy.

STATIONARY ENGINES - - 2 to 100 H. P.
PORTABLE ENGINES - - - 8 to 18 H. P.

We have a new catalog, fully describing and illustrating our line, which will be sent on request.

The Inspector AND Trouble Man.

By A. E. DOBBS.

Full of information and diagrams for the operator, exchange owner, exchange manager, inspector, trouble man, lineman.

A complete description of telephones and their troubles. How to find and remedy them, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards.

This is a practical book, written in **plain language,** and for **anyone** interested in telephony.

Mailed anywhere on receipt of price . . . **ONE DOLLAR.**

No technicalities. Substantially bound in cloth.

ELECTRICIAN PUBLISHING CO.,
510 MARQUETTE BUILDING, CHICAGO.

WATTMETERS FOR DIRECT CURRENTS

The new Duncan has all the up-to-date features that go to make it the best on the market. It will pay you to try one and investigate its merits for yourself.

Its multipoint switch method of compensating for friction and vibration is conceded to be the simplest, quickest and most reliable means yet devised. It is superior in every respect to the old and clumsy methods of adjusting the compensating coil bodily and is not damaged by lightning.

IMPORTANT NOTICE

AMERICAN CIRCULAR LOOM CO.
TRADE MARK
REGISTERED
MANUFACTURERS OF
FLEXIBLE INTERIOR CONDUIT
CANVAS JACKETS FOR INSULATED WIRE & CABLES
AND
TRADE
ELECTRODUCT
MARK

Chelsea, Mass., July 2nd, 1904.

Gentlemen:

Our attention has been called to certain reports that have been recently circulated, evidently with malicious intent with reference to an alleged action of the Underwriters in condemning "Circular Loom." We cannot believe that any of our trade will be misled by these libelous statements. But, may we not ask that you kindly refer to the list of approved appliances published by the Underwriters, April, 1904, in which you will find our material has the full sanction of the Bureau? All appliances included in this little pamphlet are recommended for use by the Underwriters and it will be apparent to you that our name would not be upon its pages unless "Circular Loom" met the requirements.

We have recently taken this matter up with the Bureau and have been assured that our material has not been condemned and that when installed in conformity with the rules laid down by the national code, it is accepted by the various bureaus throughout the United States, and ***in verification of this statement you are at liberty to communicate with the Electrical Bureau of the National Board of Fire Underwriters, 67 East 21st St., Chicago.***

Yours very truly,

AMERICAN CIRCULAR LOOM CO.

VEGETABLE FEED-WATER TREATMENT,

Proportioned to suit the Mineral Analysis of the water, will keep your boilers clean, free from corrosion, and effect great saving in repairs and operating expense.

DEARBORN DRUG & CHEMICAL WORKS,

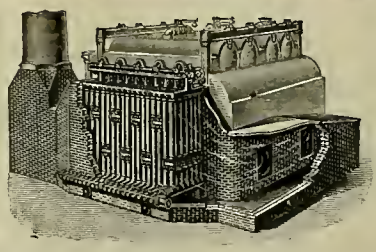
Steam Gained——Fuel Reduced

GREEN'S ECONOMIZER



Installed in any Electric Light and Power Plant produces this result. Its not a long story—simply utilizing waste gases—keeping feed-water heated above the evaporative point—saving 10 to 20% on coal bill. Additional advantages in our free booklet, which your engineer could explain to your satisfaction. Simply address

Keep Up With the Procession.

Everyone engaged in the electrical business should keep posted on the developments in the art by reading the latest books on the subject. We are headquarters in the West for electrical books and can fill orders for any work published, promptly on receipt of price. We call your special attention to the following standard books:

ALLSOP, F. C.—Electrical Bell Construction; Treatise on the Construction of Electric Bells, Indicators and similar apparatus. 177 illustrations.....$1.25

ATKINSON, PHILIP.—The Elements of Electric Lighting. Seventh edition, fully revised, and new matter added. 104 illustrations. 260 pages.....$1.50

ATKINSON, PHILIP.—The elements of Dynamic Electricity and Magnetism. 406 pages and 117 illustrations. Second edition.....$2.00

AYRTON, W. E.—Practical Electricity; a Laboratory and Lecture Course for First-year Students of Electrical Engineering, Based on the Practical Definitions of the Electrical Units. With numerous illustrations. Sixth edition.....$2.50

BADT, LIEUT F. B.—New Dynamo Tenders' Hand Book. This is, as the name indicates, a NEW BOOK, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 226 pages, 140 illustrations, flexible cloth binding, size of type page 5½x3 inches.....$1.00

BADT, LIEUT. F. B.—Incandescent Wiring Hand Book. A timely book containing full illustrations for incandescent wiring and complete information concerning methods of running wires, location of safety devices, splices, insulation, testing for faults, wire gauges, general electrical data, calculating sizes of wires, wiring fixtures, elevators, buildings, isolated and central station plants. The only book of the kind published. Type page 5½x3 inches, flexible cloth binding, 66 pages, 35 cuts and 5 tables, 3 of which are 12x18 inches.....$1.00

BADT, LIEUT. F. B.—Bell Hangers' Hand Book. Just the book for people engaged in selling, installing or handling electric batteries, electric bells, elevators, house or hotel annunciators, burglar or fire alarms, electric gas lighting apparatus, electric heat apparatus. 106 pages, 97 illustrations, flexible cloth binding. Type page 5½x3 inches.....$1.00

BADT, LIEUT. F. B.—Electric Transmission Hand Book. First edition, 3,000 copies. 97 pages, 22 illustrations, 27 original tables.....$1.00
Gives more Practical information on the subject than any work published to date. The book contains all necessary information for Power Producers, Capitalists, Agents, Engineers and Motor Inspectors. With this book anybody may make estimates on the cost of Transmission Plants.

REDELL, FRED'K AND ALBERT C. CREHORE.—Alternating Currents; An Analytical and Graphical Treatment for Students and Engineers. Second edition. 112 illustrations.....$2.50

BELL, LOUIS, PH. D.—The Art of Illumination. This is the only book in the language which deals directly with the scientific and artistic use of modern illuminants, electric and other. Cloth, 339 pages, 127 illustrations. Price.....$2.50

BONNEY, G. E.—Electro-Plater's Hand Book. A Manual for Amateurs and Young Students on Electro-Metallurgy. 60 illustrations, 208 pages. 12mo. cloth....$1.25

BOTTONE, S. R.—Electrical Instrument Making for Amateurs. A Practical Hand Book, with 48 illustrations. Fourth edition. Enlarged by a chapter on the Telephone.....$0.50

BOTTONE, S. R.—The Dynamo, How Made and How Used. A Book for Amateurs. Eighth edition, with additional matter and 39 illustrations.....$1.00

BOTTONE, S. R.—Electro-Motors. How Made and How Used. A Hand Book for Amateurs and Practical Men. Reduced to.....$0.50

BUCKLEY, W. J.—Electric Lighting Plants, Their Cost and Operation. 275 pages, many illustrations and diagrams. Paper.....$1.00

CROCKER, F. B. AND WHEELER, S. S.—The Practical Management of Dynamos and Motors. With a special chapter by H. A. Foster. Illustrated. Second edition, revised and enlarged.....$1.00

CUSHING, H. C., JR.—Standard Wiring for Electric Light and Power. A compilation of formulæ, rules and requirements from the most modern practice, and in accordance with the rules and requirements of the Boston Fire Underwriters' Union, the New England Insurance Exchange, and as recommended by the Underwriters' International Electric Association. 12mo, leather.....$1.00

DESMOND, CHAS.—Electricity for Engineers. Part I. Constant Current. A clear and comprehensive treatise on the principles, construction and operation of Dynamos, Motors, Lamps, Indicator and Measuring Instruments; also a full explanation of the electrical terms used in the work. Part II. Alternate Current Apparatus. Containing an explanation of the principles governing the generation of, and a description of the instruments and machinery used in connection with, Alternate Electric Currents. Illustrated. Revised edition.....$2.50

DOBBS, A. E.—The Inspector and Trouble Man. A practical book, written in plain language. Full of information and diagrams for the operator, exchange manager, inspector, trouble man and lineman. A complete description of telephones, how to find and remedy their troubles, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards. 106 pages. Price...$1.00

DYER, A.—Induction Coils, How Made and How Used. Third edition. Boards.....$0.50

FLEMING, J. A.—Short Lectures to Electrical Artisans. A course of Experimental Lectures delivered to a Practical Audience. Fourth edition. 74 illustrations..$1.50

FLEMING, J. A.—The Alternate Current Transformer in Theory and Practice. Vol. I. The Induction of Electric Currents. 500 pages, fully illustrated and with copious index. Second edition.....$3.00
Synopsis of contents: Chapter 1. Introductory. 2. Electro-Magnetic Induction. 3. The Theory of Simple Periodic Currents. 4. Mutual and Self Induction. 5. Dynamical Theory of Current Induction.
Vol. II. The Utilization of Induced Currents. 8vo, cloth. London, 1892.....$5.00

GAYETTY, J. W.—Motorman's Guide. A Practical Treatise on Street Railway Motors. Illustrations and diagrams. Cloth.....$0.50

GORDON.—School Electricity. Sources, Currents, Measurement, Telegraphy, Telephony, Lightning, Electrolysis, Induction, etc. 262 pages, with 140 illustrations..$2.00

GORE, G.—The Art of Electro-Metallurgy, including all Known Processes of Electro Deposition. Fourth edition.....$2.00

GRIER, THOS. G.—Wiring for Motor Circuits. A handy little pamphlet containing tables for wiring and for motor service, arranged in convenient form for ready reference.....$1.00

HASKINS, C. C.—Electricity Made Simple. 233 pages, 108 illustrations. Paper covers.....$0.50
A valuable, non-technical work for those whose opportunities for gaining information on the branches treated have been limited.

HASKINS, C. H.—The Galvanometer and Its Uses. A Manual for Electricians and Students. Fourth edition; revised.....$1.50

HASKINS.—Transformers. Their Theory, Construction and Application Simplified. 38 illustrations.....$1.25

HAWKINS, C. C. AND F. WALLIS.—The Dynamo, Its Theory, Design and Manufacture. 190 illustrations.$3.00

HAWKINS, N.—New Catechism of Electricity. A Practical Treatise Relating to the Dynamo and Motor, Wiring, the Electric Railway, Bell Fitting, etc., etc. Red leather, pocketbook form. 95 illustrations....$2.00

HOMANS, J. E., A. M.—A, B, C OF THE TELEPHONE. 352 pages, 269 illustrations. Price.....$1.00
Owing to the demand for a comprehensive book giving a clear, terse idea of the principles governing the construction, installation, care and management of telephones and their appliances, this book has been compiled. It has been the aim of the author to make this the most complete elementary book on this subject for the practical electrician, wireman, lineman and engineer, and it is written in a clear and careful style.

HOPKINS, GEO. M.—Experimental Science. Elementary, Practical and Experimental Physics. 650 illustrations.....$4.00

HOPKINSON.—Original Papers on Dynamo Machinery and Allied Subjects. Illustrated.....$1.00

HOPKINSON, DR. JOHN.—Dynamic Electricity; Its Modern Use and Measurements, Chiefly in Its Application to Electric Lighting and Telegraphy.....$0.50

HORSTMANN, H. C. AND VICTOR H. TOUSLEY.—Modern Wiring Diagrams and Descriptions. A Hand Book of Practical Diagrams and Information for Electrical Workers. 160 pages, over 200 illustrations. Full leather binding, pocket size 4x6.....$1.50

HOSPITALIER, E.—Domestic Electricity for Amateurs; Translated from the French, with additions by G. J. Wharton. With illustrations.....$2.50

HOUSTON, EDWIN J.—A Dictionary of Electrical Words, Terms and Phrases. Fourth edition, greatly enlarged, with over 6,000 additional words and definitions. 2 volumes, 1,000 pages.....$6.00

KAPP, GISBERT.—Electric Transmission of Energy and its Transformation, Subdivision and Distribution. A practical hand book. Fourth edition.....$3.00

KAPP, GISBERT.—Alternate Current Machinery. Illustrated.....$0.50
(Vol. 96. Van Nostrand's Science Series.)

KAPP, GISBERT.—Dynamos, Alternators and Transformers. 138 illustrations.....$4.00

KEMPE, H. R.—A Hand Book of Electrical Testing. Fifth edition. 200 illustrations. 8vo, cloth. London 1892.....$7.25
In this edition there is a considerable amount of new matter; the old matter has been thoroughly revised.

KEMPE, H. R.—The Electrical Engineer's Pocket Book. Modern Rules, Formulæ, Tables, and Data. 32mo, leather.....$1.75

LOCKWOOD, T. D.—Electricity, Magnetism and Electric Telegraphy. A Practical Guide and Hand Book of General Information for Electrical Students, Operators and Inspectors. 376 pages, 152 illustrations.....$2.50

LOCKWOOD, T. D.—Electrical Measurement and the Galvanometer; Its Construction and Use. Second edition.....$1.50

LYNDON, L.—Storage Battery Engineering. A Practical Treatise for Engineers. This is a practical work, intended for the electrical engineer who is called on to design and install storage battery equipments, or who has a battery power plant under his care. Cloth. 360 pages, 178 illustrations and diagrams, 4 large folding plates. Price.....$3.00

MEADOWCROFT, W. H.—The A, B, C of Electricity. 36 illustrations. 12mo, cloth. New York.....$0.50

MAYER AND DAVIS, M. M.—The Quadruplex. With Chapters on the Dynamo-Electric Machine in Relation to the Quadruplex. The Practical Working of the Duplex Telegraph Repeaters and the Wheatstone Automatic Telegraph. 63 illustrations.....$1.50

MEYER, HENRY, C., JR., M. E.—Steam Power Plants. Their Design and Construction. Cloth. 165 pages, 63 illustrations, 15 folding plates. Price.....$2.00

MILLER, KEMPSTER B.—American Telephone Practice. 518 large octavo pages, 379 illustrations.....$3.00
This book treats of the subject in a simple and comprehensive manner from the practical standpoint, and almost entirely without the use of mathematics.

NOLL, AUGUSTUS.—How to Wire Buildings. A manual of the art of interior wiring. Illustrated.....$1.50

POPE, FRANKLIN LEONARD.—Modern Practice of the Electric Telegraph. A technical hand book for Electricians, Managers and Operators. 185 illustrations. Fourteenth edition, rewritten and enlarged.....$1.50

PRINDLE, H. B.—A Popular Treatise on the Electric Railway of To-day. Fully illustrated.....$0.25

REED, LYMAN C.—American Meter Practice. This is the only American book dealing with the theory and practice of current metering. Cloth. About 250 pages. Illustrated. Price.....$2.00

RUSSELL, STUART A.—Electric Light Cables and Distribution of Electricity. 107 illustrations.....$2.25

SALOMONS, SIR DAVID.—Electric Light Installations. Vol. I. The Management of Accumulators. A Practical Hand Book. Seventh edition, revised and enlarged. With illustrations. 12mo, cl. London, 1893.....$1.50

SLOANE, T. O'CONNOR.—Electricity Simplified. The Practice and Theory of Electricity, including a Popular Review of the Theory of Electricity, with Analogies and Examples of Its Practical Application in every day life. Illustrated.....$1.00

SLOANE, T. O'CONNOR.—The Standard Electrical Dictionary. A popular dictionary of words and terms used in the practice of electrical engineering. 350 illustrations.....$3.00

SLOANE, T. O'CONNOR.—Electric Toy Making for Amateurs, including Batteries, Magnets, Motors, Miscellaneous Toys.....$1.00

SLOANE, T. O'CONNOR.—The Arithmetic of Electricity. A Manual of Electrical Calculations by Arithmetical Methods, including numerous rules, examples and tables in the field of practical electrical engineering and experimenting. Third edition, revised.....$1.00

STEVENS, H. G.—Mechanical Catechism. For Stationary and Marine Engineers, Firemen, Electricians, Motormen, Ice Machine Men and Mechanics in General. 336 pages, over 240 illustrations. Cloth.....$1.00

THOMPSON, SYLVANUS P.—Dynamo-Electric Machinery. A series of lectures, with an introduction by Franklin L. Pope. 16mo. Numerous illustrations, fancy boards (Van Nostrand's Science Series, No. 66).....$0.50

THOMPSON, SYLVANUS P.—Polyphase Electric Currents and Alternate-Current Motors. Mailed to any address in the world on receipt of.....$3.50

THOMPSON, SYLVANUS P.—Recent Progress in Dynamo-Electric Machines, being a Supplement to Dynamo-Electric Machinery. 16mo. (Van Nostrand's Science Series, No. 75).....$0.50

THOMPSON, SYLVANUS P.—Dynamo-Electric Machinery. Eighth edition, revised and rewritten. Numerous illustrations and 19 plates. Nearly 1,000 pages.....$6.00

THURSTON, PROF. R. H.—Stationary Steam Engines, Especially Adapted to Electric Lighting Purposes. Treating of the development of Steam Engines, the Principles of Construction and Economy, with description of Moderate and High Speed Engines. With many folding plates.....$2.50

TREVERT.—How to Make Electric Batteries at Home. Illustrated.....$0.25

URQUHART.—Electro-Plating. A Practical Hand Book on the Deposition of Copper, Silver, Nickel, Gold, Aluminum, Brass, Platinum, etc. Second edition; carefully revised, with additions.....$2.00

WALKER, F.—Practical Dynamo Building, for Amateurs. How to wind for any output. With numerous illustrations. 16mo, boards. (Van Nostrand's Science Series, No. 98).....$0.50

WEBB, H. L.—A Practical Guide to the Testing of Insulated Wires and Cables. Illustrated.....$1.00

WEBB, HERBERT LAWS.—Telephone Hand Book. Illustrated. 12mo, cloth. Chicago. 1895.....$1.00
The only complete work on the Telephone. All possible information for any one interested in Telephones and how to make and operate them.

WEBER.—The Handy Vest Pocket Electrical Dictionary.
Cloth.....$0.25
Leather.....$0.50

THE CONTRACT ROAD

The lamp market is a jungle where you are liable to get lost or swamped—and sure to get bit—unless you know the way. These sign boards will set you on the trail:

1st Sign—PACKARD. Turn sharply to the right here.

2nd Sign—CONTRACT. Now the path lies straight before you. It is your individual right of way and will lead you to the best lamp and the best prices.

Lamps bought on contract are "tailor made." Literally fitted to the plant. The far-sighted buyer will avail himself of contract advantages.

ELECTRICITY MADE SIMPLE.
233 Pages. 108 Illustrations. By CLARK CARYL HASKINS. Paper .50.
A BOOK DEVOID OF TECHNICALITIES—SIMPLE, PLAIN AND UNDERSTANDABLE.
There are many elementary books about electricity upon the market, but this is the first one presenting the matter in such shape that the layman may understand it, and, at the same time, not written in a childish manner.
This little work is not intended for the instruction of experts, nor as a guide for professors. The author has endeavored to bring the matter down to the level of those whose opportunities for gaining information on the branches treated have been limited.
Four chapters are devoted to Static Electricity; three each to Chemical Batteries and Light and Power; two each to Terrestrial Magnetism and Electro-Magnetism; one each to Atmospheric Electricity; Lightning Rods; Electro-Chemistry; Applied Electro-Magnetism; Force, Work and Energy; Practical Application of Ohm's Law; also a chapter upon Methods of Developing Electricity, other than Chemical.
The large number of examples that are given to illustrate the practical application of elementary principles is gaining for it a reputation as a text-book for schools and colleges.
FOR ENGINEERS, DYNAMO MEN, FIREMEN, LINEMEN, WIREMEN AND LEARNERS. FOR STUDY OR REFERENCE.

BITUMINIZED FIBRE CONDUIT

FOR

ELECTRICAL UNDERGROUND CONSTRUCTION
ELECTROLYSIS PROOF WATER PROOF

A smooth laminated insulator of unchanging durability.

Forms a continuous sealed duct from manhole to manhole, impervious to moisture and through which leaking gas cannot penetrate.

There has never been a gas explosion in our conduits nor the slightest evidence of electrolysis.

Abrasion of the cables is an impossibility.

It saves sixty per centum of freight and handling cost and twenty to thirty-five per centum of construction.

Process of laying is simple, rapid and inexpensive. There is no loss from breakage or fitting. It is self-aligning and cannot settle out of alignment.

All sizes from one inch to ten inches interior diameter. Bends of all angles.

The foremost electrical engineers are recognizing and testifying to the scientific advantages of our system of subway construction over all previous methods.

Send for illustrated book. Ask for prices giving size and quantities required

PEOPLE WHO BUY GENERATORS

FORT WAYNE ELECTRIC WORKS
WOOD LIGHTING & POWER SYSTEMS
Fort Wayne, Ind.

bearing our name-plate also buy reliable service. It is service that counts, when it is reliable.

Reliable service is continuous—uninterrupted—readiness for hard work and more of it.

That is the chief characteristic of our direct current generators.

It is not obtained by adding weight or by underrating. It is the result of the nicety with which theoretical design and practical construction are combined in these generators.

WATTMETERS FOR DIRECT CURRENTS

The new Duncan has all the up-to-date features that go to make it the best on the market. It will pay you to try one and investigate its merits for yourself.

Its multipoint switch method of compensating for friction and vibration is conceded to be the simplest, quickest and most reliable means yet devised. It is superior in every respect to the old and clumsy methods of adjusting the compensating coil bodily and is not damaged by lightning.

ELECTRICAL CONSTRUCTION

Power and Light Plants. Switchboards and Panel Boards.

We install Municipal and Isolated Electric Lighting Plants.
We manufacture Switchboards, Table boards, Iron Cutout Boxes and Electrical Specialties.
We sell Dynamos, Motors and Electrical Supplies.
We wire old as well as new Residences, Factory Buildings, School and College Buildings.

87 Fifth Avenue, Chicago, Illinois.

Weatherproof Wire

"ONE OF OUR 61 VARIETIES."

LARGE QUANTITIES CARRIED REGULARLY IN TOLEDO STOCK

We also carry large stocks of other wires for both lighting and telephone work.

The National Electrical Code (Supplement April, 1904)

Says: "The linings (of Flexible Tubing) must be secured in position so that they cannot be readily removed."

"FLEXDUCT"

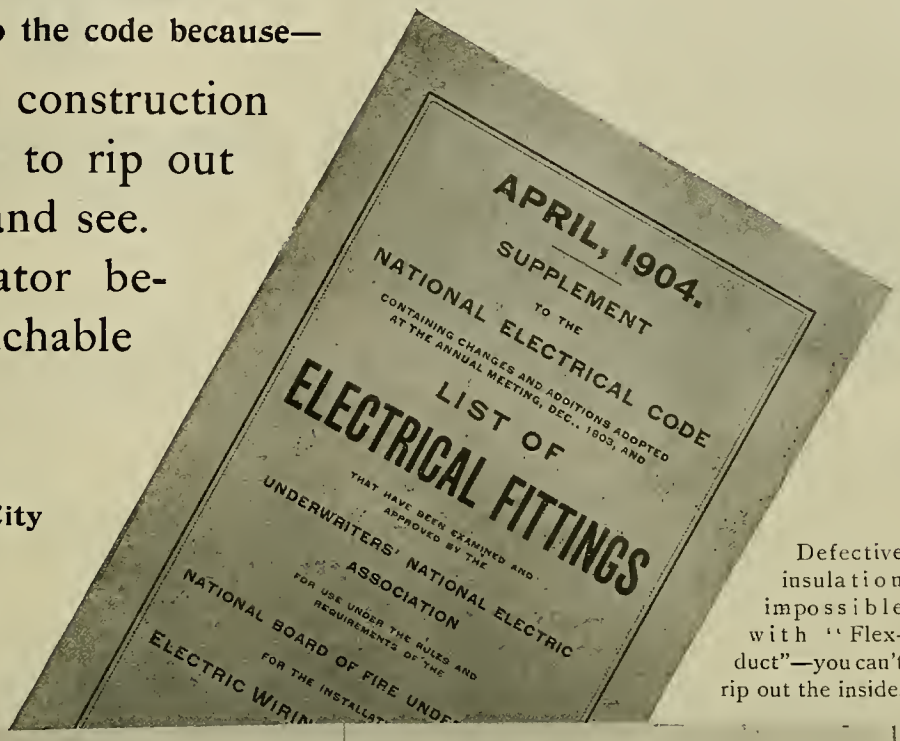
absolutely conforms to the code because—

Its peculiarly woven construction makes it impossible to rip out the inside. Try it and see.

The safest insulator because of its non-detachable interior.

Osburn Flexible Conduit Co.,
General Sales Offices,
19-21 Park Row, New York City

I. A. BENNETT,
General Western Manager
529-30 Monadnock Blk, Chicago.



Defective insulation impossible with "Flexduct"—you can't rip out the inside.

Flexduct is moisture proof, is the best mechanical protector.

Has the smoothest interior.

Is the most flexible.

This is what the Code says. Have you read it?

Write for our interesting booklet giving full particulars about "Flexduct."

6 LIST OF ELECTRICAL FITTINGS.

Also amend by striking out the second paragraph of the fine print note.

Rule 43*a*. Amend to read as follows:

"The insulation must consist of layers of cotton or other thread, all the interstices of which must be filled with the fireproofing compound, or of material having equivalent fire resisting and insulating properties. The outer layer must be braided and specially designed to withstand abrasion. The thickness of insulation must not be less than that required for slow-burning weatherproof wire and the outer surface must be finished smooth and hard."

"The solid constituent of the fireproofing compound must not be susceptible to moisture, and must not burn even when ground in an oxidizable oil, making a compound which, while proof against fire and moisture, at the same time has considerable elasticity, and which when dry will suffer no change at a temperature of 250° F., and which will not burn at even a higher temperature.

Rule 50 C. Flexible Tubing.

The following specifications are designed to cover the construction of flexible tubes for fished work, loop system and for mechanical protection to wires where not exposed to moisture.

Tubes complying with these requirements must not be used for a conduit system of wiring.

a. Must be constructed to meet the following requirements:

Must have a sufficiently smooth interior surface to allow the ready introduction of the wire.

Must be constructed of or treated with materials which will serve as moisture repellants.

Must have a substantial outer covering especially designed to withstand abrasion.

b. The linings must be secured in position so that they cannot be readily removed.

c. The tube must be thoroughly flexible at all temperatures at which it is to be used.

LIST OF ELECTRICAL FITTINGS. 7

d. Must not crack or break when kinked or flattened out.

e. Must be sufficiently tough and tenacious to withstand severe tension without injury; the interior diameter must not be diminished or the tube opened up at any point by the application of a reasonable stretching force.

f. Must not close to prevent the insertion of the wire after the tube has been kinked and straightened out, or flattened.

g. Must not soften injuriously, or cause the wire to stick within the tube when subjected to a temperature of 150° Fahr.

Rule 51*b*. Amend first fine print note by striking out the first two words "on switchboards" and inserting in place thereof the words "for 100 ampere switches and larger."

In the third line of the same note strike out the words "on switchboards."

Change the last fine print note to read as follows:

"For three-wire Edison systems the separations and break distances for plain three-pole knife switches must not be less than those required in the above table for switches designed for the voltage between the neutral and outside wires."

Rule 54 A. New Rule—Rosettes.

Ceiling rosettes, both fused and fuseless, must be constructed in accordance with the following specifications:

a. Base—Current-carrying parts must be mounted on non-combustible, non-absorptive insulating bases. There should be no openings through the rosette base except those for the supporting screws and in the concealed type for the conductors also, and these openings should not be made any larger than necessary.

There must be at least 1/4" space, measured over the surface, between supporting screws and current-carrying parts. The supporting screws

THE CONTRACT ROAD

The lamp market is a jungle where you are liable to get lost or swamped—and sure to get bit—unless you know the way. These sign boards will set you on the trail:

1st Sign—PACKARD. Turn sharply to the right here.

2nd Sign—CONTRACT. Now the path lies straight before you. It is your individual right of way and will lead you to the best lamp and the best prices.

Lamps bought on contract are "tailor made." Literally fitted to the plant. The far-sighted buyer will avail himself of contract advantages.

BITUMINIZED FIBRE CONDUIT

FOR

ELECTRICAL UNDERGROUND CONSTRUCTION
ELECTROLYSIS PROOF WATER PROOF

A smooth laminated insulator of unchanging durability.
Forms a continuous sealed duct from manhole to manhole, impervious to moisture and through which leaking gas cannot penetrate.
There has never been a gas explosion in our conduits nor the slightest evidence of electrolysis.
Abrasion of the cables is an impossibility.
It saves sixty per centum of freight and handling cost and twenty to thirty-five per centum of construction.
Process of laying is simple, rapid and inexpensive. There is no loss from breakage or fitting. It is self-aligning and cannot settle out of alignment.
All sizes from one inch to ten inches interior diameter. Bends of all angles.
The foremost electrical engineers are recognizing and testifying to the scientific advantages of our system of subway construction over all previous methods.

Send for illustrated book. Ask for prices giving size and quantities required

Crocker-Wheeler. Brown, Boveri.

By arrangement with the celebrated electrical engineers, Brown, Boveri & Cie. of Baden, Switzerland, the Crocker-Wheeler Company has secured their alternating current designs, patents and rights to manufacture in America, and has retained them as consulting engineers.

Crocker-Wheeler Company is now putting on the market alternating current generators, transformers and accessories of the most perfect design and construction, adapted to American practice. Opportunities to bid on this apparatus are invited.

⅔ Actual Size. Patented.

CROWN CORD ADJUSTER

BEST AND SIMPLEST. MADE OF HARD RUBBER.

No Slip, No Abrasion, No Removing socket, Easily attached

Price $4.00 Per Hundred. Liberal Discount to the Trade.

Sample Free.

J. H. SEAMAN, 175 Dearborn St., Chicago

Security Conduit Rods

Experience develops that the best coupling is the one jointed the easiest and quickest and which holds the rods firmly together without slack and without danger of separation in the duct, and which easily uncouples when removing

These rods are easily handled in manholes, quickly jointed and unjointed, and will stand abuse. The couplings lock together rigidly, so rods will not buckle under pressure nor bind against conduit walls. There is no slack between rods.

Prices, 36 inches, each $0.50 48 inches, each $0.60 Send for catalogs on Security specialties.

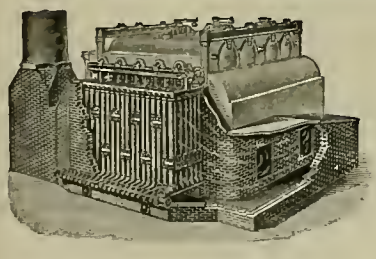
If the Installation of a

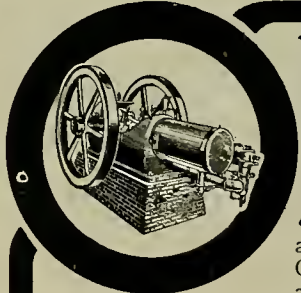
GREEN'S ECONOMIZER



Were long an expense, then you would be justified in deliberating, but under ordinary conditions, depending largely upon coal cost, it soon pays for itself by utilizing waste gases. **Electric light and power plants** find it a paying investment outside of the 10 to 20% saving on coal bill. Ask for explanation through our experts, also for booklet, both free.

***The* Green Fuel Economizer Co.**

Matteawan, N. Y. *Sole Manufacturers in the U. S.*



Olds Gas and Gasoline Engines

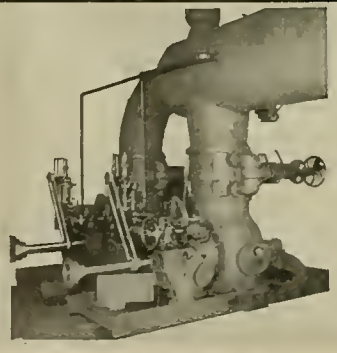
are strong and simple in construction. Parts are few and easily understood. Olds engines can be readily operated by any man of ordinary intelligence without previous experience. Repairs, though seldom necessary, can be quickly and economically made.

Stationary Engines - - 2 to 100 H. P.
Portable Engines - - 8 to 18 H. P.

For complete information and new illustrated catalog write

OLDS GASOLINE ENGINE WORKS,

252 River Street, - - Lansing, Mich.



SAMSON TURBINE

If the SPEED of the turbine is to be controlled by a GOVERNOR, the turbine should be of such capacity that it will develop the MAXIMUM POWER required, when operating at ¾ to ⅞ gate, then when an overload is thrown on, the governor can open the gates wider and allow an increase in power. The EFFICIENCY of the SAMSON between ¾ and ⅞ gate is over 84%.

WRITE DEPT. D FOR CATALOG

JAMES LEFFEL & CO.

SPRINGFIELD, OHIO U. S. A.

BITUMINIZED FIBRE CONDUIT

FOR

ELECTRICAL UNDERGROUND CONSTRUCTION
ELECTROLYSIS PROOF WATER PROOF

A smooth laminated insulator of unchanging durability.

Forms a continuous sealed duct from manhole to manhole, impervious to moisture and through which leaking gas cannot penetrate.

There has never been a gas explosion in our conduits nor the slightest evidence of electrolysis.

Abrasion of the cables is an impossibility.

It saves sixty per centum of freight and handling cost and twenty to thirty-five per centum of construction.

Process of laying is simple, rapid and inexpensive. There is no loss from breakage or fitting. It is self-aligning and cannot settle out of alignment.

All sizes from one inch to ten inches interior diameter. Bends of all angles.

The foremost electrical engineers are recognizing and testifying to the scientific advantages of our system of subway construction over all previous methods.

Send for illustrated book. Ask for prices giving size and quantities required

THE CONTRACT ROAD

The lamp market is a jungle where you are liable to get lost or swamped—and sure to get bit—unless you know the way. These sign boards will set you on the trail:

1st Sign—PACKARD. Turn sharply to the right here.

2nd Sign—CONTRACT. Now the path lies straight before you. It is your individual right of way and will lead you to the best lamp and the best prices.

Lamps bought on contract are "tailor made." Literally fitted to the plant. The far-sighted buyer will avail himself of contract advantages.

ELECTRIC APPLIANCE COMPANY

ELECTRICAL SUPPLIES

CHICAGO and SAN FRANCISCO

Northern variable speed motors operate on the two-wire single voltage system and can be driven from the same circuit as supplies current for the constant speed motors and lighting current.

PRACTICAL FEATURES OF TELEPHONE WORK.

By A. E. DOBBS.

Cloth, 7 by 5 1-4 inches. Illustrated. 134 pages. Appendix. 75 Cents.

THIS work is designed as a simple, plain-speaking handbook for the practical telephone man. Its author, Mr. Dobbs, has been eminently fitted by fourteen years' experience in telephony to deal with the subject in a thoroughly competent manner. This he has done, and the result is a mine of information, clearly and concisely presented, and invaluable to the manager, operator and lineman alike. The appendix contains reliable data regarding wires, resistance, inductive capacity, etc.

This or any other book on telephony or electricity sent to any address, postpaid, on receipt of price.

THE TRAIL OF LEWIS AND CLARK

was the pioneer American trail west of the Missouri river and the results of that exploration of 1804-6 were of tremendous importance to the United States and they were never more apparent than now.

A publication relating to the Lewis and Clark expedition, just issued by **G. P. Putnam's Sons, New York**, stands peculiarly alone. This edition is a two-volume, 8 vo one, called "**The Trail of Lewis and Clark, 1804-1904.**" The author, Mr. Olin D. Wheeler, is the well known writer of the popular **Wonderland** series of the Northern Pacific Railway, in connection with which he made his studies and researches for this work.

Mr. Wheeler has traveled several thousand miles over the route of Louis and Clark. He has camped out, climbed mountains, followed old Indian trails, and visited remote points made memorable by those explorers. Their route across the Bitterroot mountains has been followed, identified and mapped.

"**The Trail of Lewis and Clark**" is illustrated in color and half tone from **paintings, drawings, and maps**, by Paxson, De Camp and Russell, made under Mr. Wheeler's direction and from photographs taken especially for the purpose. The writer tells his own story and supplements it with pertinent extracts from Lewis and Clark, and a host of other historical and narrative writers that connect the past with the present. Exact excerpts and photographic reproductions, in half tone from the ORIGINAL MANUSCRIPT JOURNALS of Lewis and Clark are given. A chapter is devoted to the Louisiana Purchase, another to the preparatory measures for the exploration, and another to the history of each man of the expedition so far as known, including a discussion of the death of Captain Lewis.

The Louisiana Purchase Exposition at St. Louis, and the **Lewis and Clark Centenoial** to be held at Portland, Oregon, in 1905, make this work peculiarly timely, because written from the standpoint of actual knowledge of past and present conditions of the old trail and country.

"**The Trail of Lewis and Clark**" should be found in every public and private library in the land and the general reader will find in reading through its pages of large clear type that truth is, indeed, stranger than fiction.

The book can be ordered through any bookseller or news stand or direct from the publishers

The business of the Western Electrician for the year 1903 was the largest in its history of 17 years.

New Dynamo Tenders' Hand-Book.

By F. B. BADT.

226 Pages, 140 Illustrations. Flexible Cloth Binding. Size of Type Page 5 1-2x3 inches. Price $1.00.

This is, as the name indicates, a NEW BOOK, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 9,000 copies of the old Dynamo Tenders' Hand-Book sold, and over 13,000 of the new.

A Bird's-eye View of Details

reveals a harmonious union of little points of excellence that enables our direct-current generators to perform their work with unvarying reliability—with ease, but with enduring regularity.

An extended and elaborate illustrated description of these generators is given in our Bulletin No. 1050, which will be sent free to anyone interested in high-grade, direct-current, engine-driven generators of any size between 20 and 800 kilowatts. Ask for it.

Good Advice

No. 2.

Every central station manager fully appreciates that when he uses the Type A Duncan Direct Current Wattmeter he is supplying energy to his customers through an instrument that is guaranteed to be permanently accurate on all loads; one that measures the exact amount consumed; no more, no less. It is his best means of securing the absolute confidence of his patrons and fortifying his ability to pay dividends to the stockholders of his company.

Good Advice No. 3 Next Week.

New York Philadelphia Chicago London

334

Warren Alternator

Very little attention has been paid to decorating the machine with fancy ornaments and a great deal of thought has been put into making the machine durable; it impresses one with its simplicity and capacity for severe acting service. No commutator, no moving wire, no trouble. As an investment, they are gilt edged securities. They are "seven leagued boots" in the chase for the almighty dollar.

WHITNEY INSTRUMENTS ENJOINED

Full opinion of His Honor Judge Wheeler, concurred in by His Honor Judge Lacombe in the case of the

WESTON ELECTRICAL INSTRUMENT CO., Complainant

VS.

WHITNEY ELECTRICAL INSTRUMENT CO., Defendant

This suit is brought upon patent No. 392387 dated November 6, 1888, and granted to Edward Weston for an Electrical Measuring Apparatus, which was adjudged to be valid in Weston Electrical Instrument Co. *vs.* Jewell Electrical Instrument Co. et al in this court in March, 1904. It has now been heard upon a motion for a preliminary injunction.

The principal question made now is as to infringement. **The parts of the defendant's instrument look quite differently from the corresponding parts of the instrument of the patent, but notwithstanding these differences in form they are there in the instrument and do the same things in substantially the same way.** This appears quite well from the description of the two instruments in parallel columns in the affidavit of Frank W. Roller, defendant's record on this motion, page 3. The great thing to be done appears to have been to get the movable coil in its diamagnetic frame into a permanent magnetic field, compactly, and to carry the current to be measured from side to side through the coil, and move the coil against steady resistance to measure the current, and record the measurement. Weston seems to have accomplished this by mounting the frame by pivots on non-conducting bridge-pieces, and carrying the current to be measured to and from the movable coil through springs connected with the frame furnishing steady resistance, and a pointer connected with the frame and moving over a scale to show the movement and the measurement of the current.

Any electrical mechanic could provide the permanent magnetic field, and the form of it would not be material except to permit the movement of the frame carrying the coil. The mounting of the frame on the bridge-pieces by pivots with its arrangement and connections was the important part of Weston's patented invention.

The defendant's instruments have the permanent magnetic field provided by a magnet and core of different and perhaps better shapes in some respects, but permitting movement of the frame in an arc of a circle to carry a pointer moving over a scale to indicate the measurement of the current. **If these changes of forms are even patentable improvements the defendants have taken and used the invention of the patent in making and using those improvements.**

The difference in the form of the parts carrying the frame on pivots supported by the bridge-pieces is of the same sort. It does not vary the mechanical operation of the parts. **These differences do not, any or all of them, amount to doing the same thing in different ways, but leave the operative parts doing the same thing in the same way.**

According to these views the motion should be granted.

HOYT H. WHEELER,
Judge.

FOR PLAINTIFF:
WILLIAM HOUSTON KENYON.

FOR DEFENDANTS:
CLIFTON V. EDWARDS.

Upon re-examination of the record, I concur in the opinion above expressed by Judge Wheeler.

July 18, 1904.

E. HENRY LACOMBE,
U. S. C. J.

(ENDORSED) Circuit Court of the United States, for the Southern District of New York—Weston Electrical Instrument Company *vs.* Whitney Electrical Instrument Company *et al.*—Opinion, WHEELER, J.—United States Circuit Court, Southern District of New York. Filed July 20, 1904. John A. Shields, Clerk.

SAMSON TURBINE

The illustration shows the large NIAGARA design, HORIZONTAL SHAFT TURBINES recently installed by us for the NIAGARA FALLS HYDRAULIC POWER & MANUFACTURING CO., Niagara Falls, N. Y. Tests conducted by competent engineers developed as follows:

Head	Gateage	Speed	H-P	Generator Efficiency	Turbine Efficiency
213 ft.	1-2	257 r. p. m.	1750	95 per cent	.730 per cent
213 "	3-4	257 " "	3000	95 " "	.856 " "
213 "	Full	257 " "	3500	95 " "	.815 " "

These results have never been equaled by any turbine of the Horizontal Shaft Design, operating under equally HIGH HEADS. The test was made **AFTER TURBINES WERE INSTALLED,** direct coupled to Generators. Francis' weirs and formulæ for discharge was used. The original test reports on file at our offices. These turbines are all fitted with our SAMSON BALANCED GATES. Write Department D for catalogue.

Note especially the UNIFORM SPEED at ALL GATEAGES

BITUMINIZED FIBRE CONDUIT

FOR

ELECTRICAL UNDERGROUND CONSTRUCTION
ELECTROLYSIS PROOF WATER PROOF

A smooth laminated insulator of unchanging durability.

Forms a continuous sealed duct from manhole to manhole, impervious to moisture and through which leaking gas cannot penetrate.

There has uever been a gas explosion in our conduits nor the slightest evidence of electrolysis.

Abrasion of the cables is an impossibility.

It saves sixty per centum of freight and handling cost and twenty to thirty-five per centum of construction.

Process of laying is simple, rapid and inexpensive. There is no loss from breakage or fitting. It is self-aligning and cannot settle out of alignment.

All sizes from one inch to ten inches interior diameter. Bends of all angles.

The foremost electrical engineers are recognizing and testifying to the scientific advantages of our system of subway construction over all previous methods.

Send for illustrated book. Ask for prices giving size and quantities required

THE TRAIL OF LEWIS AND CLARK

was the pioneer American trail west of the Missouri river and the results of that exploration of 1804-6 were of tremendous importance to the United States and they were never more apparent than now.

A publication relating to the Lewis and Clark expedition, just issued by **G. P. Putnam's Sons, New York**, stands peculiarly alone. This edition is a two-volume, 8 vo one, called "**The Trail of Lewis and Clark, 1804-1904.**" The author, Mr. Olin D. Wheeler, is the well known writer of the popular **Wonderland** series of the Northern Pacific Railway, in connection with which he made his studies and researches for this work.

Mr. Wheeler has traveled several thousand miles over the route of Louis and Clark. He has camped out, climbed mountains, followed old Indian trails, and visited remote points made memorable by those explorers. Their route across the Bitterroot mountains has been followed, identified and mapped.

"**The Trail of Lewis and Clark**" is illustrated in color and half tone from **paintings, drawings, and maps**, by Paxson. De Camp and Russell, made under Mr. Wheeler's direction and from photographs taken especially for the purpose. The writer tells his own story and supplements it with pertinent extracts from Lewis and Clark, and a host of other historical and narrative writers that connect the past with the present. Exact excerpts and photographic reproductions, in half tone from the ORIGINAL MANUSCRIPT JOURNALS of Lewis and Clark are given. A chapter is devoted to the Louisiana Purchase, another to the preparatory measures for the exploration, and another to the history of each man of the expedition so far as known, including a discussion of the death of Captain Lewis.

The Louisiana Purchase Exposition at St Louis, and the **Lewis and Clark Centennial** to be held at Portland, Oregon, in 1905, make this work peculiarly timely, because written from the standpoint of actual knowledge of past and present conditions of the old trail and country.

"**The Trail of Lewis and Clark**" should be found in every public and private library in the land and the general reader will find in reading through its pages of large clear type that truth is, indeed, stranger than fiction.

The book can be ordered through any bookseller or news stand or direct from the publishers

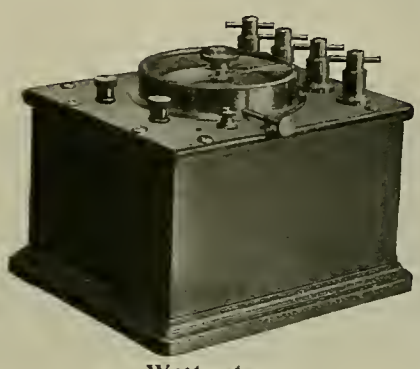
Announcement

New Standard Instruments

With Free Calibration Service

Voltmeter



Wattmeter

Ammeter

For Direct and Alternating Currents

We Announce the development of Semi-Portable Instruments of Precision of a new type, greatly superior to all others now in use. Their introduction marks the beginning of a new era in electrical measurements.

We Further Announce that the Westinghouse Department of Standards will recalibrate these instruments free of charge upon request at any time within five years of date of purchase. This service will eliminate all the present troubles due to inaccurate standards, and is an important innovation in electrical practice.

One Westinghouse Instrument of Precision has the range of several standard instruments of different capacities of any other manufacture. Free calibration ensures the preservation of their initial accuracy.

Telephone Booth Fan Motors

The only place where silence is really golden is in a telephone booth—that is, after the talk begins.

The door must be closed to keep outside noise outside, and inside talk inside. Inside air becomes heated and the talker wishes for a fan motor. If he had the ordinary kind he would be unable to use it because of the rumble and roar of vibration of booth and wind in his ears.

The telephone booth "Wood" fan motor is a specialty that has been given special study and fulfills every requirement.

In telephone booths or cabinets these motors are practically without a rival. There is not another motor on the market that so fully meets the requirements of this service.

"Wood" telephone booth fan motors are small, light and slower in speed than any other "Wood" fan motors. The motor is suspended on three spiral springs of calculated resiliency which deaden all vibration.

It is small enough to be mounted on the side of the cabinet and give just the proper amount of breeze in just the right direction.

Special windings permit the use of these motors in series with an incandescent lamp lighting the booth and at the same time cooling it. The circuit can be so arranged that closing the door starts the motor and lights the lamp and opening it turns off the current.

The total energy consumption for series operation is practically the same as for lamp alone.

The suspended revolving type attached to a lamp socket is also a necessary comfort these days

Good Advice

No. 3

Nothing exasperates the manager of a central station more, than having complaints come to him from his customers, charging that their meters are "running too fast," or from his meter reading department, that many of the readings are certainly "too slow." The conditions are experienced daily in many plants and many meters are productive of just such results. The present Duncan Direct Current Wattmeter is a guaranteed proof against such erratic departures from straight line accuracy.

Announcement

— BY THE —

WHITNEY ELECTRICAL INSTRUMENT COMPANY

The Whitney Electrical Instrument Company announces that, being firmly convinced that the direct-current measuring instruments made and sold by it infringe on no patents or rights whatsoever and, having the opinion of eminent counsel that such is the case, it has taken an appeal from the opinion recently handed down by Judge Wheeler. The Whitney Electrical Instrument Company is and will remain ready to supply its full line of admittedly superior measuring instruments for direct current and for alternating current but, pending its appeal, the direct-current instruments will, for the further reassurance of our customers be of a type containing no moving wire and hence entirely removed from any possibility of question or dispute. The instruments referred to are dead beat, have equally divided scales and the ammeters can be used interchangeably on the same shunts as our old type.

In conclusion, the Whitney Electrical Instrument Company reiterates its assurance of readiness to undertake the defense of any suits brought against its customers for alleged infringement. August 1, 1904

The S. K. C. Inductor Alternator

Ability to Start Up
Oil Up
Shut Up
And occasionally Clean Up

is all that is required to operate the Inductor Alternator as built by the Stanley Electric Manufacturing Company.
Does simplicity appeal to you? You have it in the Inductor with no moving wires, brushes, commutator or collector rings.
Do you desire inexpensive operation? The inductor has nothing to renew, and only the bearings require attention.
Are your facilities for handling machinery limited? The Inductor is not difficult to install.
Bulletins Nos. 123 and 128 tell all about it. Send for them.

BITUMINIZED FIBRE CONDUIT

FOR

ELECTRICAL UNDERGROUND CONSTRUCTION
ELECTROLYSIS PROOF WATER PROOF

A smooth laminated insulator of unchanging durability.

Forms a continuous sealed duct from manhole to manhole, impervious to moisture and through which leaking gas cannot penetrate.

There has never been a gas explosion in our conduits nor the slightest evidence of electrolysis.

Abrasion of the cables is an impossibility.

It saves sixty per centum of freight and handling cost and twenty to thirty-five per centum of construction.

Process of laying is simple, rapid and inexpensive. There is no loss from breakage or fitting. It is self-aligning and cannot settle out of alignment.

All sizes from one inch to ten inches interior diameter. Bends of all angles.

The foremost electrical engineers are recognizing and testifying to the scientific advantages of our system of subway construction over all previous methods.

Send for illustrated book. Ask for prices giving size and quantities required

A Trip Through Yellowstone Park

is what everyone hopes to have—**some day.** It is the most wonderful trip in the world. There are more than 3,000 square miles of weird, marvelous, unimaginable things that can be seen nowhere else, therefore if one ever sees them one **must** go to the Park, in the heart of the magnificent Rockies with snow tipped peaks all around. If Old Faithful geyser, a Paint Pot, Mud Volcano, or Emerald Pool were to be found in Lincoln Park, Chicago; Central Park, New York; or Fairmount Park, Philadelphia; the people would flock to see it or them by tens of thousands. For a very small sum, comparatively, all these and hundreds more of nature's unduplicated marvels can be seen between June 1 and September 30, of each year, and one will enjoy, to boot, the best coaching trip in the country.

The **Northern Pacific** folder on Yellowstone Park, just issued, is a new, right up to date, finely illustrated dessertation on this Yellowstone Park trip. It is not descriptive, but deals with the detailed, technical matters everyone needs to know about such a trip. It tells all about the hotels, the stage coaches, the roads, the cost of the tour; where the geysers, the waterfalls, the bears, the canyons are, and where the trout fishing is found. We have printed thousands of this beautiful leaflet and want everybody interested to have a copy, and it can be obtained by sending A. M. Cleland, General Passenger Agent, St. Paul, Minn., **two cents** with proper address.

"Wonderland 1904" which is a very fine pamphlet of 116 pages, descriptive of the Northwest, including the Park, will be sent for **six cents.**

Locations for Industries.

Good Advice

No. 4

When a meter operates too fast the central station manager is cheating his customer by having him pay for energy he did not use, and when a meter operates too slow the manager is cheating himself. Mr. Manager, are you guilty? If you are, try a Duncan Direct Current Wattmeter; if you are not guilty, then you are already one of our customers.

CHICAGO

"Big Reliable" Engine
at the
St. Louis Exposition

Largest Singie Engine Ever Placed On Exhibition

Popularly Known At Exposition As "Big Reliable"

Allis-Chalmers 5,000 h. p. Engine and Bullock 3,500 k. w. Electric Generator, which furnish current for Decorative Lighting of Exposition Grounds and Buildings.

From the time steam was first turned on, this Engine has worked perfectly. It furnishes daily, in addition to the lighting work at night, 3,000 h. p. to the St. Louis Transit Company.

We build smaller Engines in sizes from 25 h. p. upward.

Separate Phase Regulation.

In connection with S. K. C. INDUCTOR ALTERNATORS and S. K. C. REVOLVING FIELD TYPE GENERATORS, we recommend the use of our separate phase regulating device.

This device when desired, is furnished as a part of the generator. No additional transformers or boosters are required and the regulating head or terminal board may be mounted on the machine or on the switchboard, as desired.

By this means the voltage of one phase may be varied irrespective of the other.

The potential of one phase even may be raised while that of the other is lowered without any inconvenience resulting.

This can be done only on the S. K. C. INDUCTOR and the S. K. C. REVOLVING FIELD TYPE GENERATOR.

Do you realize the advantages derived from such even regulation?

Will you let us send you Bulletin No. 112 showing how we do it?

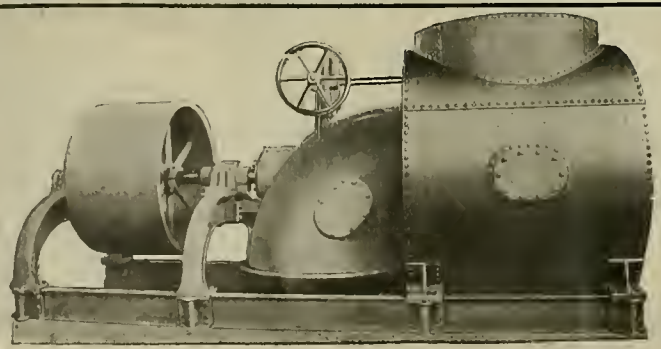
There's No Friction

with the Fibre-Graphite Commutator Brush. Being 90 per cent. pure graphite, it insures low resistance, no sparking under a varying load, and longer wear. There is no greasing required. The Fibre-Graphite is therefore the most economic brush on the market. Send for price list.

HOLMES FIBRE-GRAPHITE MFG. CO.
5155 Wakefield St., Germantown, PHILADELPHIA.



SAMSON TURBINE

The EASE and QUICKNESS with which the gates on the SAMSON are operated make that turbine especially desirable for use where the SPEED of the turbine is to be controlled by a GOVERNOR. CLOSE REGULATION is assured.

WRITE DEPT. D FOR CATALOG

JAMES LEFFEL & CO.

SPRINGFIELD, OHIO U. S. A.

THE MONTH OF SEPTEMBER 1904

will be a memorable one in electrical circles.

The International Electrical Congress,

The American Institute of Electrical Engineers,

The National Electrical Contractors' Association,

The Northwestern Electrical Association,

The International Association of Municipal Electricians,

The American Electrochemical Society,

The American Electrotherapeutic Association.

will all meet in St. Louis during the week beginning September 12th. The Independent Telephone Association of the U. S. will be held in St. Louis beginning September 21. A number of State conventions will also be held during the month.

The September issues of the WESTERN ELECTRICIAN, therefore, will prove unusually interesting to everyone in any way connected with the trade.

Advertisers will find these numbers well worthy of extra space, and it will pay those not regularly represented to begin a standing card now.

WESTERN ELECTRICIAN, 510 MARQUETTE BLDG., CHICAGO.

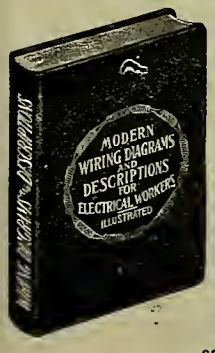
ALL Live men read the WESTERN ELECTRICIAN Each Week. Do You?

PLACE YOUR "Want" and "For Sale" advertisements in the WESTERN ELECTRICIAN. Immediate Returns.

READ THE BLUE ELECTRICAL PAPER.



A PRACTICAL BOOK
FOR PRACTICAL MEN
"MODERN WIRING DIAGRAMS AND DESCRIPTIONS FOR ELECTRICAL WORKERS."
By Henry C. Horstmann and Victor H. Tousley. 160 pages, over 200 illustrations. Full leather binding, red edges. Pocket size 4 x 6. Price, net, $150.
A work that not only tells you how to do it, but shows you.
THIS BOOK tells how to wire for call and alarm bells. For burglar and fire alarm. How to run bells from dynamo current. How to install and manage batteries. How to test batteries. How to test circuits. How to wire for annunciators; for telegraph and gas lighting. It tells how to locate "trouble" and "ring out" circuits. It tells about meters and transformers. It contains 30 diagrams of electric lighting circuits alone. It explains dynamos and motors; alternating and direct current. It gives 10 diagrams of ground detectors alone. It gives "Compensator" and Storage Battery installation. It gives simple and explicit explanations of the "Wheatstone Bridge," and its uses as well as volt-meter and other testing. It gives a new and simple wiring table, covering all voltages and all losses or distances, etc., etc.

BITUMINIZED FIBRE CONDUIT

FOR

ELECTRICAL UNDERGROUND CONSTRUCTION
ELECTROLYSIS PROOF WATER PROOF

A smooth laminated insulator of unchanging durability.
Forms a continuous sealed duct from manhole to manhole, impervious to moisture and through which leaking gas cannot penetrate.
There has never been a gas explosion in our conduits nor the slightest evidence of electrolysis.
Abrasion of the cables is an impossibility.
It saves sixty per centum of freight and handling cost and twenty to thirty-five per centum of construction.
Process of laying is simple, rapid and inexpensive. There is no loss from breakage or fitting. It is self-aligning and cannot settle out of alignment.
All sizes from one inch to ten inches interior diameter. Bends of all angles.
The foremost electrical engineers are recognizing and testifying to the scientific advantages of our system of subway construction over all previous methods.

A Trip Through Yellowstone Park

is what everyone hopes to have—**some day**. It is the most wonderful trip in the world. There are more than 3,000 square miles of weird, marvelous, unimaginable things that can be seen nowhere else, therefore if one ever sees them one **must** go to the Park, in the heart of the magnificent Rockies with snow tipped peaks all around. If Old Faithful geyser, a Paint Pot, Mud Volcano, or Emerald Pool were to be found in Lincoln Park, Chicago; Central Park, New York; or Fairmount Park, Philadelphia; the people would flock to see it or them by tens of thousands. For a very small sum, comparatively, all these and hundreds more of nature's unduplicated marvels can be seen between June 1 and September 30, of each year, and one will enjoy, to boot, the best coaching trip in the country.

The **Northern Pacific** folder on Yellowstone Park, just issued, is a new, right up to date, finely illustrated dessertation on this Yellowstone Park trip. It is not descriptive, but deals with the detailed, technical matters everyone needs to know about such a trip. It tells all about the hotels, the stage coaches, the roads, the cost of the tour; where the geysers, the waterfalls, the bears, the canyons are, and where the trout fishing is found. We have printed thousands of this beautiful leaflet and want everybody interested to have a copy, and it can be obtained by sending A. M. Cleland, General Passenger Agent, St. Paul, Minn., **two cents** with proper address.

"Wonderland 1904" which is a very fine pamphlet of 116 pages, descriptive of the Northwest, including the Park, will be sent for **six cents.**

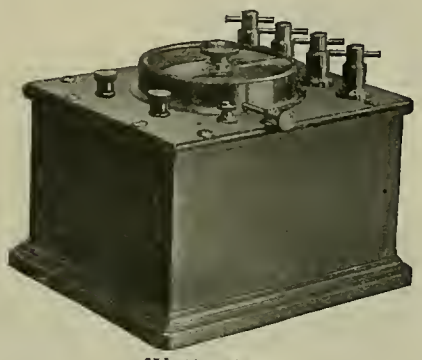
Westinghouse

Semi=Portable

Instruments of Precision

With Free Calibration Service

Voltmeter



Wattmeter

Ammeter

For Direct and Alternating Currents

The Instruments combine the accuracy of the best stationery laboratory instruments, with the convenience of the ordinary portable standards. Large open divisions of scale, equally legible over entire range. Vernier for reading fractional parts of divisions, and slow motion handle for fine adjustment. One of these precision instruments will do the work of several standards of different capacities of any other manufacture, and with an accuracy they cannot attain.

Free Calibration For five years the Westinghouse Department of Standards will check these instruments of precision free of charge, owner paying carriage only. Shipping case provided. Nominal charge for repairs. No delay in returning.

Descriptive Literature
Now Ready

The Inspector
AND
Trouble Man.
By A. E. DOBBS.

Full of information and diagrams for the operator, exchange owner, exchange manager, inspector, trouble man, lineman.

A complete description of telephones and their troubles. How to find and remedy them, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards.

This is a practical book, written in **plain language**, and for **anyone** interested in telephony.

Mailed anywhere on receipt of price . . . ONE DOLLAR.

No technicalities. Substantially bound in cloth.

ELECTRICIAN PUBLISHING CO.,
510 MARQUETTE BUILDING, CHICAGO.

Good Advice

No. 5.

When you wish to ascertain which meter on the market will fill all of your requirements, viz., extreme accuracy, reliability of operation, freedom from weakening magnets, etc., don't be talked into adopting one because it is cheap or because it has been on the market for a long period. Send for a Duncan Direct Current Wattmeter and test it for yourself. It won't cost you a cent if you do not find it satisfactory in every respect.

Good Advice No. 6 Next Week.

Write for Bulletin and Prices.

STANLEY INSTRUMENT CO.
GREAT BARRINGTON, MASS.

Crocker-Wheeler. Brown, Boveri.

By arrangement with the celebrated electrical engineers, Brown, Boveri & Cie. of Baden, Switzerland, the Crocker - Wheeler Company has secured their alternating current designs, patents and rights to manufacture in America, and has retained them as consulting engineers.

Crocker-Wheeler Company is now putting on the market alternating current generators, transformers and accessories of the most perfect design and construction, adapted to American practice. Opportunities to bid on this apparatus are invited.

The S. K. C. Inductor Alternator

Ability to Start Up
Oil Up
Shut Up
And occasionally Clean Up

is all that is required to operate the Inductor Alternator as built by the Stanley Electric Manufacturing Company.

Does simplicity appeal to you? You have it in the Inductor with no moving wires, brushes, commutator or collector rings.

Do you desire inexpensive operation? The Inductor has nothing to renew, and only the bearings require attention.

Are your facilities for handling machinery limited? The Inductor is not difficult to install.

Bulletins Nos. 123 and 128 tell all about it. Send for them.

THE MONTH OF SEPTEMBER 1904

will be a memorable one in electrical circles.

The International Electrical Congress,

The American Institute of Electrical Engineers,

The National Electrical Contractors' Association,

The Northwestern Electrical Association,

The International Association of Municipal Electricians,

The American Electrochemical Society,

The American Electrotherapeutic Association

will all meet in St. Louis during the week beginning September 12th. The Independent Telephone Association of the U. S. will be held in St. Louis beginning September 21. A number of State conventions will also be held during the month.

The September issues of the WESTERN ELECTRICIAN, therefore, will prove unusually interesting to everyone in any way connected with the trade.

Advertisers will find these numbers well worthy of extra space, and it will pay those not regularly represented to begin a standing card now.

Keep Up With the Procession.

Everyone engaged in the electrical business should keep posted on the developments in the art by reading the latest books on the subject. We are headquarters in the West for electrical books and can fill orders for any work published, promptly on receipt of price. We call your special attention to the following standard books:

ALLSOP, F. C.—Electrical Bell Construction; Treatise on the Construction of Electric Bells, Indicators and similar apparatus. 177 illustrations.....$1.25

ATKINSON, PHILIP.—The Elements of Electric Lighting. Seventh edition, fully revised, and new matter added. 104 illustrations. 260 pages.....$1.50

ATKINSON, PHILIP.—The elements of Dynamic Electricity and Magnetism. 406 pages and 117 illustrations. Second edition.....$2.00

AYRTON, W. E.—Practical Electricity; a Laboratory and Lecture Course for First-year Students of Electrical Engineering. Based on the Practical Definitions of the Electrical Units. With numerous illustrations. Sixth edition.....$2.50

BADT, LIEUT F. B.—New Dynamo Tenders' Hand Book. This is, as the name indicates, a NEW BOOK, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 226 pages, 140 illustrations, flexible cloth binding, size of type page 5½x3 inches.....$1.00

BADT, LIEUT. F. B.—Incandescent Wiring Hand Book. A timely book containing full illustrations for incandescent wiring and complete information concerning methods of running wires, location of safety devices, splices, insulation, testing for faults, wire gauges, general electrical data, calculating sizes of wires, wiring fixtures, elevators, buildings, isolated and central station plants. The only book of the kind published. Type page 5½x3 inches, flexible cloth binding, 66 pages, 35 cuts and 5 tables, 3 of which are 12x18 inches.....$1.00

BADT, LIEUT. F. B.—Bell Hangers' Hand Book. Just the book for people engaged in selling, installing or handling electric batteries, electric bells, elevators, house or hotel annunciators, burglar or fire alarms, electric gas lighting apparatus, electric heat apparatus. 106 pages, 97 illustrations, flexible cloth binding. Type page 5½x3 inches.....$1.00

BADT, LIEUT. F. B.—Electric Transmission Hand Book. First edition, 3,000 copies. 97 pages, 22 illustrations, 27 original tables.....$1.00
Gives more Practical information on the subject than any work published to date. The book contains all necessary information for Power Producers, Capitalists, Agents, Engineers and Motor Inspectors. With this book anybody may make estimates on the cost of Transmission Plants.

BEDELL, FRED'K AND ALBERT C. CREHORE.—Alternating Currents; An Analytical and Graphical Treatment for Students and Engineers. Second edition. 112 illustrations.....$2.50

BELL, LOUIS, PH. D.—The Art of Illumination. This is the only book in the language which deals directly with the scientific and artistic use of modern illuminants, electric and other. Cloth, 339 pages, 127 illustrations. Price.....$2.50

BONNEY, G. E.—Electro-Plater's Hand Book. A Manual for Amateurs and Young Students on Electro-Metallurgy. 60 illustrations, 208 pages. 12mo. cloth....$1.25

BOTTONE, S. R.—Electrical Instrument Making for Amateurs. A Practical Hand Book, with 48 illustrations. Fourth edition. Enlarged by a chapter on the Telephone.....$0.50

BOTTONE, S. R.—The Dynamo, How Made and How Used. A Book for Amateurs. Eighth edition, with additional matter and 39 illustrations.....$1.00

BOTTONE, S. R.—Electro-Motors. How Made and How Used. A Hand Book for Amateurs and Practical Men. Reduced to.....$0.50

BUCKLEY, W. J.—Electric Lighting Plants, Their Cost and Operation. 275 pages, many illustrations and diagrams. Paper.....$1.00

CROCKER, F. B. AND WHEELER, S. S.—The Practical Management of Dynamos and Motors. With a special chapter by H. A. Foster. Illustrated. Second edition, revised and enlarged.....$1.00

CUSHING, H. C., JR.—Standard Wiring for Electric Light and Power. A compilation of formulæ, rules and requirements from the most modern practice, and in accordance with the rules and requirements of the Boston Fire Underwriters' Union, the New England Insurance Exchange, and as recommended by the Underwriters' International Electric Association. 12mo, leather.....$1.00

DESMOND, CHAS.—Electricity for Engineers. Part I. Constant Current. A clear and comprehensive treatise on the principles, construction and operation of Dynamos, Motors, Lamps, Indicator and Measuring Instruments; also a full explanation of the electrical terms used in the work. Part II. Alternate Current Apparatus. Containing an explanation of the principles governing the generation of, and a description of the instruments and machinery used in connection with, Alternate Electric Currents. Illustrated. Revised edition.....$2.50

DOBBS, A. E.—The Inspector and Trouble Man. A practical book, written in plain language. Full of information and diagrams for the operator, exchange manager, inspector, trouble man and lineman. A complete description of telephones, how to find and remedy their troubles, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards. 108 pages. Price...$1.00

DYER, A.—Induction Coils, How Made and How Used. Third edition. Boards.....$0.50

FLEMING, J. A.—Short Lectures to Electrical Artisans. A course of Experimental Lectures delivered to a Practical Audience. Fourth edition. 74 illustrations..$1.50

FLEMING, J. A.—The Alternate Current Transformer in Theory and Practice. Vol. I. The Induction of Electric Currents. 500 pages, fully illustrated and with copious index. Second edition.....$3.00
Synopsis of contents: Chapter 1. Introductory. 2. Electro-Magnetic Induction. 3. The Theory of Simple Periodic Currents. 4. Mutual and Self Induction. 5. Dynamical Theory of Current Induction.
Vol. II. The Utilization of Induced Currents. 8vo, cloth. London, 1892.....$5.00

GAYETTY, J. W.—Motorman's Guide. A Practical Treatise on Street Railway Motors. Illustrations and diagrams. Cloth.....$0.50

GORDON.—School Electricity. Sources, Currents, Measurement, Telegraphy, Telephony, Lightning, Electrolysis, Induction, etc. 262 pages, with 140 illustrations..$2.00

GORE, G.—The Art of Electro-Metallurgy, including all Known Processes of Electro Deposition. Fourth edition.....$2.00

GRIER, THOS. G.—Wiring for Motor Circuits. A handy little pamphlet containing tables for wiring and for motor service, arranged in convenient form for ready reference.....$1.00

HASKINS, C. C.—Electricity Made Simple. 233 pages, 108 illustrations. Paper covers.....$0.50
A valuable, non-technical work for those whose opportunities for gaining information on the branches treated have been limited.

HASKINS, C. H.—The Galvanometer and Its Uses. A Manual for Electricians and Students. Fourth edition, revised.....$1.50

HASKINS.—Transformers. Their Theory, Construction and Application Simplified. 38 illustrations.....$1.25

HAWKINS, C. C. AND F. WALLIS.—The Dynamo, Its Theory, Design and Manufacture. 190 illustrations.$3.00

HAWKINS, N.—New Catechism of Electricity. A Practical Treatise Relating to the Dynamo and Motor, Wiring, the Electric Railway, Bell Fitting, etc., etc. Red leather, pocketbook form. 95 illustrations....$2.00

HOMANS, J. E., A. M.—A, B, C OF THE TELEPHONE. 352 pages, 269 illustrations. Price.....$1.00
Owing to the demand for a comprehensive book giving a clear, terse idea of the principles governing the construction, installation, care and management of telephones and their appliances, this book has been compiled. It has been the aim of the author to make this the most complete elementary book on this subject for the practical electrician, wireman, lineman and engineer, and it is written in a clear and careful style.

HOPKINS, GEO. M.—Experimental Science. Elementary, Practical and Experimental Physics. 650 illustrations.....$4.00

HOPKINSON.—Original Papers on Dynamo Machinery and Allied Subjects. Illustrated.....$1.00

HOPKINSON, DR. JOHN.—Dynamic Electricity; Its Modern Use and Measurements, Chiefly in Its Application to Electric Lighting and Telegraphy.....$0.50

HORSTMANN, H. C. AND VICTOR H. TOUSLEY.—Modern Wiring Diagrams and Descriptions. A Hand Book of Practical Diagrams and Information for Electrical Workers. 160 pages, over 200 illustrations. Full leather binding, pocket size. 4x6.....$1.50

HOSPITALIER, E.—Domestic Electricity for Amateurs; Translated from the French, with additions by C. J. Wharton. With illustrations.....$2.50
